ERES INSTITUTE FOR NEW AGE CYBERNETICS

SESSION REPORT

Biomedical Lagrange Points

Complete Development Arc: v1.0 → v2.0 → v3.0

Two-Round MIEVM Validation | Investor Brief Production

April 17, 2026

Joseph Allen Sprute (ERES Maestro)
Bella Vista, Arkansas | ORCID: 0000-0001-9946-3221

Amended Edition (v2.0 of Session Report)

1. Session Metadata

Date	April 17, 2026
Session Type	White Paper Development + Two-Round MIEVM Validation + Investor Brief
Author	Joseph Allen Sprute (ERES Maestro)
Working Document	ERES-BIO-LP-WP-2026-001 — Biomedical Lagrange Points
MIEVM Instruments	Claude (Anthropic) | ChatGPT (OpenAI) | DeepSeek | Grok (xAI)
Versions Produced	v1.0 (outline) → v2.0 (MIEVM-revised) → v3.0 (investor brief)
MIEVM Rounds	Round 1: v1.0 ratings (mean 8.15) | Round 2: v2.0 ratings (mean 9.25)
License	CCAL v2.1 (CC BY-SA 4.0 text | MIT code | ODC-BY data | CERN-OHL-S v2 hardware)
Deliverables	5 documents (see §9 Deliverables Manifest)

---

2. Session Context: The Aurora Exchange

This session was triggered by a WhatsApp conversation between Joseph A. Sprute and Ms. Aurora, a biomedical investment professional connected via David N. Benson. The exchange occurred across the evening of April 16 and morning of April 17, 2026.

Ms. Aurora's stated interest: Clinical trial infrastructure implementing robotic technology, ML/AI systems, focused on oncology and cancer. Long-term vision to become a creator of innovative drugs targeting diseases once considered incurable.

Sprute's response vectors: Resonance testing, Non-Punitive Remediation, personalized medicine as means to health-improvement (not sustained consumption), sugar-salt-water chemistry, atmospheric health, and GraceChain/Meritcoin as incentive architecture.

2.1 Three Design Mandates from the Exchange

- ***"I said that only because this doesn't exist"*** — the absence as design mandate
- **"Goodness sake" = Healthy + Happy + Safe** — the HHS triad mapping to SELF · OTHERS · FUTURE
- ***"I'll make it real for you"*** — commitment to translate cybernetic architecture into investable framework

---

3. Phase 1: v1.0 Outline Production

The initial outline (ERES-BIO-LP-WP-2026-001-OUTLINE.md) mapped the Aurora conversation themes to ERES architectural patterns. The central innovation was mapping five classical Lagrange Points of celestial mechanics to biomedical equilibrium positions between DISEASE and TREATMENT.

3.1 v1.0 L-Node Architecture

Node	v1.0 Name	Timescale	Principle	Stability	v2.0 Rename
L1	Personal Node	Short-term	SELF	Unstable	— (retained)
L2	Public Node	Medium-term	OTHERS	Unstable	Clinical Node
L3	Private Node	Long-term	FUTURE	Unstable	Population Node
L4	Weaning Equilibrium	Transitional	SELF→FUTURE	Stable	— (retained)
L5	Planetary Health	Generational	FUTURE	Stable	— (retained)

Seven-part architecture: Problem Space, Five BLP Nodes, Resonance Testing, Oncology Exemplar, Investment Architecture, Regulatory Governance, Conclusion.

---

4. Phase 2: MIEVM Round 1 (v1.0 Ratings)

The v1.0 outline was submitted to four parallel AI instruments. Each rated independently.

4.1 Round 1 Scores

Instrument	Score	Top Strength	Primary Gap
Claude	8.2	Systemic vision, ERES integration	Evidence balance, accessibility for outsiders
ChatGPT	8.7	Structure, L1–L5 mapping clarity	Poetic claims need operational metrics
DeepSeek	8.5 / 5.0	Philosophical coherence, geometry	Empirical operationalization; regulatory bridge
Grok	7.2	Vision/originality (9/10 sub-score)	Investability (5/10); no pilot; no negative-outcome governance
MEAN	**8.15**		

4.2 Round 1 Consensus Gaps (8 items)

#	Gap	Raised By	Resolution in v2.0

1	Clinical definition of resonance	All four	New §1.4: HRV, BIA, speech-formant, EDA, metabolomics
2	L1–L5 summary table with metrics	All four	Reference table with operational metric per node
3	ERES Primer / glossary for outsiders	All four	New ERES Primer section + Appendix A
4	Minimal-viable clinical pilot	Grok (primary), all	New §4.4: NSCLC/HR+ breast cancer, n=80, HRV primary
5	Full abstract	Claude, ChatGPT, DeepSeek	Complete abstract with problem/method/exemplar/outcome
6	Regulatory pathway specifics	DeepSeek (primary), Grok	USP ⟨797⟩/⟨800⟩, 21 CFR Part 11, FHIR/HL7, FDA Pre-Sub
7	Negative outcome governance	Grok (primary)	Asymmetric accrual: gains earn, losses trigger NPR not penalty
8	L2/L3 naming confusion	Grok (primary)	L2→Clinical; L3→Population; geometric rationale

5. Phase 3: v2.0 Revision

All eight Round 1 consensus gaps were resolved in the v2.0 outline (ERES-BIO-LP-WP-2026-001-OUTLINE-v2.md). Major additions: §1.4 Clinical Definition of Resonance (five biomarker domains), §3.4 Methodological Realism Pathway (Phase 0–4), §4.4 Minimal-Viable Clinical Pilot (NSCLC/HR+ breast cancer, n=80), L4 Negative Outcome Governance (asymmetric Meritcoin accrual, NASA ASRS model), ERES Primer, L1–L5 Reference Table, full Abstract, VERTECA as open standard with FHIR/HL7 interoperability, and three new appendices (orbital diagram, regulatory pathway, MIEVM validation record).

6. Phase 4: MIEVM Round 2 (v2.0 Ratings)

The v2.0 outline was resubmitted to all four instruments for second-round validation.

6.1 Round 2 Scores and Progression

Instrument	v1.0	v2.0	Delta	Remaining Gaps for v3.0
Claude	8.2	9.1	+0.9	ROI scenario expansion; adjunct-not-replacement language; acronym reduction; orbital diagram; HPE insider density
ChatGPT	8.7	9.2	+0.5	Concrete patient walkthrough L1→L5; executive summary; validation pathways table; diagram

DeepSeek	8.5/5.0	9.6	+4.6	BERA ARI normalization/statistical plan; regulation-to-L-node matrix; payer recognition path
Grok	7.2	9.1	+1.9	HRV specificity for Phase 3; Meritcoin redemption mechanics; L5 reframe; MIEVM disclosure; acronym count
MEAN	**8.15**	**9.25**	**+1.10**	

6.2 Key Observations on Round 2

Largest single improvement: DeepSeek's clinical-feasibility score rose from 5.0 to 9.6 (+4.6), driven by §1.4 resonance definition and §3.4 methodological realism pathway. This confirms that the paper's original conceptual strength was always present—the deficit was operationalization, not vision.

Grok's investability: Rose from 5.0 to 8.5 (+3.5), the second-largest sub-score gain across both rounds. The §4.4 pilot design and cost-delta estimation transformed the document from "cybernetic manifesto" to "partnership working paper."

Convergence: All four instruments converged to a 9.1–9.6 band in Round 2, compared to a 7.2–8.7 band in Round 1. The narrowing range indicates consensus stabilization—remaining gaps are executional refinements, not structural flaws.

---

7. Phase 5: v3.0 Investor Brief Production

The v3.0 document was produced as an investor-facing Word document (ERES-BIO-LP-INVESTOR-BRIEF-v3.docx), reframing the entire BLP framework for investment and clinical-partnership audiences. It resolves all eleven remaining gaps identified in Round 2.

7.1 Round 2 Gap Resolutions in v3.0

#	Gap	Source	v3.0 Resolution
1	Patient walkthrough L1→L5	ChatGPT	Maria scenario: breast cancer patient journey through all five nodes
2	Meritcoin redemption mechanics	Grok	Four redemption paths: reduced premiums, L3 payment, community donation, beneficiary transfer + inflation control
3	HRV specificity for Phase 3	Grok	Explicit disclosure: Phase 3 needs treatment-attributable signal or randomized design to isolate confounders
4	L5 reframe	Grok	Ecological sensor hypothesis (population HRV as early warning, not causal intervention); not near-term

5	MIEVM disclosure	Grok	Callout: LLMs are coherence checkers, not clinicians; independent clinical review required
6	ROI scenario	Claude	Full ROI table: 1.7–5.0× return on monitoring investment
7	BERA ARI normalization	DeepSeek	Z-score against 30-day rolling baseline; weighted geometric mean; 0–100 index
8	Regulation-to-L-node matrix	DeepSeek	Five-row table: HIPAA/FHIR/USP/21CFR/EPA mapped to L1–L5
9	Acronym reduction	Grok / Claude	10 core terms in Key Terms table; all others in appendix glossary only
10	Adjunct-not-replacement framing	Claude	Callout box after patient walkthrough: resonance metrics alongside standard endpoints, not standalone
11	Validation pathway table	ChatGPT	Phase 0–4 table with activity, endpoint, and review authority per phase

7.2 v3.0 Structural Innovations

The investor brief restructured the entire document around the investor's decision process: Executive Summary (problem → solution → mechanism → pilot → ask), ROI Scenario (1.7–5.0× return), Key Terms (10-term limit), Patient Journey (Maria walkthrough), Clinical Pilot (design table), Revenue Model (five sources + Meritcoin redemption), Governance (negative-outcome clause + regulatory matrix + L5 reframe), MIEVM Record (score progression + disclosure), and Partnership Structure (provides/receives table).

---

8. MIEVM Epistemological Note

The Multi-Instrument Ensemble Validation Method deployed four AI systems as parallel critique nodes, each bringing different architectural biases. The ensemble was culled from a larger original set due to solo-researcher bandwidth constraints—the same constraint-based epistemology that produced the 72 Key Domains in CyberRAVE (culled from the Register of Collective Indices based on TLD renewal capacity).

> **MIEVM Disclosure:** All four instruments are large language models with overlapping training corpora and no independent clinical, financial, or regulatory standing. MIEVM functions as a coherence check and structured critique methodology—not external validation. Independent clinical review by qualified professionals is required before any investment or clinical decision.

The MIEVM's value is not in averaging scores but in identifying the lowest-scoring dimensions and resolving them specifically. Grok's 5/10 investability and DeepSeek's 5.0/10 clinical feasibility in Round 1 identified the two most consequential gaps. Both were resolved by

Round 2 (Grok → 8.5 investability; DeepSeek → 8.8 clinical realism). The remaining Round 2 gaps were executional, not structural.

---

9. Deliverables Manifest

#	Document	Filename	Format	Status
1	v1.0 White Paper Outline	ERES-BIO-LP-WP-2026-001-OUTLINE.md	Markdown	Complete
2	v2.0 MIEVM-Revised Outline	ERES-BIO-LP-WP-2026-001-OUTLINE-v2.md	Markdown	Complete
3	Session Report (original)	ERES-BIO-LP-SESSION-REPORT.docx	Word	Superseded
4	v3.0 Investor Brief	ERES-BIO-LP-INVESTOR-BRIEF-v3.docx	Word	Complete
5	Session Report (amended)	ERES-BIO-LP-SESSION-REPORT-AMENDED.docx	Word	Complete
—	**Complete Package (ZIP)**	**ERES-BIO-LP-COMPLETE-PACKAGE.zip**	**ZIP**	**Complete**

---

10. Next Steps

1. **Expand v3.0 investor brief to full-prose white paper** (30–40 pages for clinical partner review)
2. Develop §4.4 pilot into standalone IRB-ready study protocol
3. **Produce BLP orbital diagram** (Appendix G)
4. **Extract 1-page executive summary** for rapid distribution
5. **Prepare ResearchGate abstract package** (RG #410 or next)
6. **Re-submit v3.0 to MIEVM** for Round 3 confirmation (target: 9.5+ all instruments)
7. **Secure clinical partner sign-off on §4.4 pilot** — the bridge from metaphor to protocol

---

11. Session Closing

This session produced five documents across three versions and two MIEVM validation rounds, moving the Biomedical Lagrange Points framework from initial outline (mean score 8.15) to investor-ready brief (mean score 9.25). The complete package is archived as a single ZIP file for distribution and record-keeping.

"Don't hurt yourself. Don't hurt others. Build for generations to come."
