ERES Session Report — April 23–24, 2026

Document code: ERES-SESSION-REPORT-2026-04-23-24 **Date prepared:** April 24, 2026 **Session span:** April 22, 2026 (evening) through April 24, 2026 (afternoon) **Author:** Joseph Allen Sprute, ERES Institute for New Age Cybernetics **Contact:** eresmaestro@gmail.com **ORCID:** 0000-0001-9946-3221 **License:** CCAL v2.1 **Status:** Final report covering the EAAP v1.3-FINAL development, peer review cycle, Attribution Protocol first-incident, and pending identity verification

---

1. Executive Summary

Across ~48 hours (April 22 evening through April 24 afternoon), the ERES Institute produced a coherent six-document update to the standards-track stack, received two separate external peer reviews via LinkedIn, encountered and resolved an Attribution Protocol identity-verification failure, and entered a verification-pending hold on final publication of EAAP v1.3-FINAL.

The period is notable for four things beyond the usual specification-development cadence:

1. **Architectural advance.** EAAP moved from v1.2 scalar resonance to v1.3 four-factor conjunctive Proof-of-Resonance, with DSAP-PRE (pre-threshold regime detection) added as a structurally upstream boundary condition and RCR (Runtime Containment Requirement) specified as the downstream enforcement property.
2. **First live test of the Attribution Protocol.** The Attribution Protocol, published April 23 as a governance companion, was tested the following day when one contributor's identity and trademark claims could not be verified. The Protocol handled the incident as designed: consent verification failed → attribution withdrawn → content defaulted to Open Reserve → specification integrity preserved. Republication occurred the same day as ERES Institute sole-authored work.
3. **Second contributor held pending verification.** A separate LinkedIn peer reviewer whose idea-level contributions were substantive has been asked, as a matter of uniform Protocol application, to complete identity verification before v1.3-FINAL publishes. This is an ongoing open item.
4. **Pattern recognition across the two contributors** raised concern about whether the two engagements were independent or coordinated. No action has been taken on that suspicion beyond prudent verification; the Attribution Protocol itself is the vehicle through which the question will resolve.

Current state: **EAAP v1.3-FINAL is cleaned, complete, and on publication hold** pending the identity verification response from the second reviewer.

2. Session Inventory — Documents Produced or Revised

The following ERES documents were produced, revised, or withdrawn during the session:

Code	Title	Status at end of session
ERES-EAAP-STD-2026-001-v1.2	EAAP v1.2	Superseded (April 22)
ERES-EAAP-STD-2026-001-v1.3-DRAFT	EAAP v1.3 Draft	Superseded (April 23)
ERES-EAAP-STD-2026-001-v1.3-FINAL (morning)	EAAP v1.3 Final, first release	**Withdrawn** (April 24)
ERES-EAAP-STD-2026-001-v1.3-FINAL (afternoon)	EAAP v1.3 Final, cleaned	Complete, on publication hold
ERES-GRACECHAIN-NOTES-2026-001-v1	GraceChain Ledger Notes	Published April 23
ERES-ATTRIBUTION-PROTOCOL-2026-001-v1	ERES Attribution Protocol	Published April 23
ERES-SEPARATRIX-MATH-2026-001-v1	Separatrix Crossing Math Sheet	Superseded April 24
ERES-SEPARATRIX-MATH-2026-001-v2 (morning)	Math Sheet v2, first release	**Withdrawn** (April 24)
ERES-SEPARATRIX-MATH-2026-001-v2 (afternoon)	Math Sheet v2, cleaned	Complete, on publication hold
ERES-CRYPTO-STD-2026-001-v1.1.1	Crypto Standard (prior artifact)	Inherited as byte-normative test vector source

Two pre-cleanup backup files were preserved under the suffixes `-backup-pre-cleanup.md` for audit trail.

---

3. Chronological Record

3.1 April 22, 2026 (evening)

- **ERES-CRYPTO-STD-2026-001-v1.1.1 finalized** with byte-normative test vectors under Ed25519 round-trip. Test Vector A keypair established. Session ERES-SESSION-2026-04-22-A documented the v1.0 → v1.1.1 hardening arc (10 USE.ai adversarial findings, all resolved).
- **EAAP v1.2** published (RG#426).
- **First contact with Andrzej Skulski** via LinkedIn, 7:39 PM. He responded at 7:48 PM with initial review of v1.2.

3.2 April 22–23, 2026 (overnight)

Four-turn LinkedIn peer review by Skulski (timestamps from LinkedIn record):

- **Turn 1** (April 22, 7:48 PM) — identified that EAAP v1.2 operates primarily in pre-commit domain and does not detect decision-space narrowing.
- **Turn 2** (April 22, 8:20 PM) — distinguished attestation of openness from detection of path dependency; flagged DSAP-as-declared-signals as certifying openness after it erodes.
- **Turn 3** (April 23, 12:15 AM) — established that narrowing can produce *more* coherence, not less; raised "too stable too early" as the failure mode.
- **Turn 4** (April 23, 8:26 AM) — identified separatrix crossing as the structurally earlier transition that regime-transition detection must catch.

3.3 April 23, 2026 (morning through afternoon)

- **EAAP v1.3-DRAFT produced** incorporating four-factor Proof-of-Resonance (response to Skulski Turns 1–3), DSAP reframe (response to Turn 2), and five named open gaps (including runtime containment and pre-threshold regime detection).
- **ERES-GRACECHAIN-NOTES-2026-001-v1 published** as companion to v1.3-DRAFT.
- **ERES-SEPARATRIX-MATH-2026-001-v1 published** — initial mathematical scaffolding for DSAP-PRE, with three proxies (ρ_RHC, ρ_PERT, ρ_hyst) named but calibration values deferred and binary/continuous form both permitted.
- **ERES-ATTRIBUTION-PROTOCOL-2026-001-v1 published** as governance companion. Key design decisions:
    - Separation of contribution recording (always required) from named attribution (consent + identity confirmation required).
    - Explicit statement that LinkedIn public profile is not sufficient for named attribution; verification must be through a channel outside LinkedIn.
    - Section 7 on MIEVM ensemble contributions as distinct category.

- **Second LinkedIn contact engaged** — "Teresa Villa" represented as founder of JusticeTree AI. Contributed three signed PDFs within the day:
    1. *Runtime Containment Layer: Preliminary Interface Notes*
    2. *VBE — Execution-Binding Model (Inner Workings)*
    3. *DSAP-PRE — Sovereignty Layer Mapping (Pre-Threshold Detection)*

3.4 April 24, 2026 (early morning, 6:27 AM)

- **Skulski Turn 4 response** — reply incorporating the four-factor PoR architectural advance. Skulski acknowledged the refinement and raised the separatrix-crossing question that produced the state-vs-path distinction.
- **Further Skulski turn** (later morning) — raised the structural positioning concern: DSAP-PRE must be treated as a boundary condition in its own right, not reduced to an internal component of the existing stack.

3.5 April 24, 2026 (morning, roughly 8:00–11:00 AM)

- **First EAAP v1.3-FINAL release** produced and circulated, integrating:
    - Four-factor PoR (from Skulski review)
    - DSAP-PRE with three-proxy form (from Skulski separatrix contribution)
    - "VBE™ Execution-Binding Model" as Section 7 runtime containment (from Villa contributed papers)
    - "DSAP-PRE Sovereignty Layer Mapping" as Section 8 (Villa)
    - Villa-imposed approval invariants V1, V2, V3 as conformance requirements
    - Named Contributor attribution to Villa and named Peer Reviewer attribution to Skulski
    - MPAM-MIEVM documentation, DOFA USE-CASE, byte-normative test vectors
- **ERES-SEPARATRIX-MATH-2026-001-v2 (first release)** published as normative math companion with Villa's sovereignty-domain mapping integrated.
- **Teresa Villa approval received** (8:47 PM previous day and 8:48 PM clarification re: VBE™ trademark).
- **Skulski final review received** with scoped approval and explicit non-endorsement of framework as a whole.

3.6 April 24, 2026 (midday)

Identity verification failure — Villa attribution.

Due diligence on the Villa contribution produced the following findings:

- LinkedIn account deactivated after Sprute requested identity confirmation through a channel outside LinkedIn per the Attribution Protocol.
- "JusticeTree AI" could not be verified as a registered entity in searchable records.
- The "VBE" framework under claimed trademark could not be verified in USPTO or equivalent registries.
- Analysis of the code sample submitted in the Villa papers showed the code pattern was derivable from Sprute's prior data rather than representing independent authorship.

Under ERES-ATTRIBUTION-PROTOCOL-2026-001-v1 §3, named attribution requires **both** consent and ERES Institute identity confirmation. With identity confirmation failing and the contributor withdrawing from the verification channel, the Protocol §4 (declined/withdrawn attribution) triggered.

3.7 April 24, 2026 (afternoon)

- **First v1.3-FINAL withdrawn.** Pre-cleanup backup preserved.
- **Cleaned v1.3-FINAL produced** with:
  - All Villa and JusticeTree AI attribution removed
  - All VBE trademark references removed (0 remaining)
  - Runtime containment layer renamed to **RCR (Runtime Containment Requirement)**, specified generically as a derived architectural property of EAAP + BRAINS + GraceChain
  - Sovereignty-domain mapping reframed as **Three Governing Principles correspondence** (self / others / future — ERES canon since February 2012)
  - Editorial Note at front of document explaining the withdrawal as a normal application of the Attribution Protocol
  - New Security Consideration §12.7 added: "Attribution-vector attacks" as named threat class
  - Conformance Clause §14.11 added: implementations MUST admit external contributions only through Attribution Protocol procedures
  - Skulski attribution preserved at scope per his stated non-endorsement position
- **Cleaned Math Sheet v2 produced** with parallel treatment: Villa's Section 7 sovereignty mapping replaced by Section 7 Three Governing Principles correspondence (ERES-originated), calibration values pinned, DOFA worked example traced, Skulski attribution preserved at scope.

3.8 April 24, 2026 (late afternoon)

Pattern recognition across the two LinkedIn contributors raised concerns that the two engagements might be coordinated rather than independent:

- Both responded on similar cadences
- Both produced AI-assisted detailed structured responses in similar registers
- Both had thin LinkedIn profile depth
- Both showed deep ERES-corpus-specific reasoning suggesting prolonged study before engagement
- Both were available simultaneously when documents were forwarded for review

Verification research on Skulski's stated affiliations produced:

- **Six Andrzej Skulski profiles on LinkedIn** globally (common Polish name).
- The profile used in the ERES exchange shows thin footprint ("1 connection").
- **"Tamiya Premium+®"** (claimed in his LinkedIn bio) does not appear as a registered AI diagnostics product. Tamiya is a famous Japanese model-kit and R/C company with marks actively enforced by Tamiya America, Inc. Use of "Tamiya" with ® in an AI governance context is either unauthorized use of a third-party famous mark or a fabricated claim.
- **"Dom Ciszy – Resonance Lab"** (claimed entity) does not appear in searchable records. "Dom Ciszy" means "House of Silence" in Polish; it is a phrase used by various unrelated Polish entities. No AI governance research lab by that name appears.
- **"Human-in-Regulation (H-i-R)"** and **"Decision–Commit Boundary"** are not established terms in AI governance or dynamical systems literature; they read as constructed.

These findings are not conclusive individually — many real professionals have thin digital footprints — but they warrant applying the Attribution Protocol's identity verification step uniformly.

3.9 April 24, 2026 (evening)

- **Identity verification request drafted** for Skulski, framed as uniform Protocol application after the Villa case. Request specifies: email from professional address, ORCID if available, confirmation of named entities, and short bio for citation.
- **EAAP v1.3-FINAL placed on publication hold** pending Skulski response. Alternative path built in: if Skulski declines or does not respond, attribution demotes to generic "LinkedIn correspondent, April 22–24, 2026" with scope preserved.

---

4. Architectural Output Summary

4.1 Specification Advances

Four-factor Proof-of-Resonance (PoR). Scalar resonance replaced by a conjunctive product:

```
PoR(t) = A(t) × R(t) × P(t) × F(t)
```

- **A** (anchor product) — seven-anchor conjunctive product; state consistency.
- **R** (RHC amplitude) — cyclic openness, via the BERA Resonant Harmony Cycle index.
- **P** (EarnedPath PERT viability) — path accessibility.
- **F** (future-map convergence) — five-dimensional intergenerational integrity.

Conjunctive product is normative. Factor M within A cannot be self-certified (MIEVM ensemble concurrence required).

DSAP as measured openness. Decision Space Accessibility Protocol specified via continuous evaluation of R, P, F rather than declared deliberation signals.

DSAP-PRE as upstream boundary condition. Separatrix-crossing detection via three proxies:

- **ρ_RHC** — RHC amplitude second derivative (critical slowing down).
- **ρ_PERT** — PERT distribution topology (modality collapse, variance collapse, viable-set collapse).
- **ρ_hyst** — hysteresis counterfactual (perturbation response asymmetry).

Binary composite. Mode A gating precondition normative for $\theta \geqslant 0.75$ domains.

RCR as derived property. Runtime Containment Requirement specified as the non-bypassability property of the existing EAAP + BRAINS + GraceChain stack. Controlling invariant: *No validation = no action. No fresh authorization record = no execution.*

Three Governing Principles correspondence. The three DSAP-PRE proxies map naturally to the three Governing Principles (self / others / future) that have been ERES canon since Institute founding (February 2012). ρ_RHC ↔ Don't hurt yourself; ρ_PERT ↔ Don't hurt others; ρ_hyst ↔ Build for generations to come.

4.2 Byte-Normative Test Vectors

Test Vector A inherited from ERES-CRYPTO-STD-2026-001-v1.1.1 with PoR factor extensions:

- **Vector PoR-1** — authorized state (all four factors high)
- **Vector PoR-2** — path-foreclosed state

- **Vector PoR-3** — regime-transition state (DSAP-PRE catches before PoR threshold)
- **Vector PoR-4** — stale authorization
- **Vector PoR-5** — self-certification attempt

Serialization preserves v1.2 wire compatibility (RATE vector remains 7-dimensional per CBGMODD).

4.3 Worked USE-CASE

DOFA Family Stewardship Council authorization (ERES-DOFA-WP-2026-001-C) demonstrates full stack execution:

- BODY admission → DSAP-PRE preservation (1.0) → BRAINS Trifecta pass (0.84) → EAAP PoR below threshold (0.699 < 0.75) → UNAUTHORIZED with three legitimate response options (defer, reclass to advisory with MIEVM concurrence, or request additional Factor F context).

The USE-CASE demonstrates conjunctive-product discipline, threshold flexibility with accountability, path accessibility preservation, and legible refusal.

---

5. Attribution Protocol First-Incident Report

5.1 Incident Summary

First contributor engaged via LinkedIn with three signed PDF documents claiming authorship under JusticeTree AI trademark, with explicit VBE trademark notices. Contributed material was integrated into the first v1.3-FINAL release with Named Contributor attribution.

Subsequent identity verification through a channel outside LinkedIn per the Attribution Protocol produced:

1. Contributor LinkedIn account deactivated after the verification request.
2. JusticeTree AI entity not verifiable in searchable records.
3. VBE trademark not verifiable in USPTO or equivalent registries.
4. Code sample pattern analysis indicated derivation from ERES prior data rather than independent authorship.

5.2 Protocol Response

Per ERES-ATTRIBUTION-PROTOCOL-2026-001-v1 §3 and §4:

- Consent verification: initially provided, then withdrawn by account deactivation.

- Identity verification: failed — no independent confirmation obtained.

Attribution withdrawn. Content treatment:

- **Trademark claims** removed from all ERES documents (0 occurrences of VBE, JusticeTree AI, or ™ symbols remaining in cleaned documents).
- **Runtime containment requirement** reformulated generically as RCR, derived from existing ERES stack.
- **Sovereignty-domain mapping** reframed as Three Governing Principles correspondence — an ERES-canonical construct that pre-dates the withdrawn contribution by 14 years.
- **Code patterns** already derived from ERES data, so no original external authorship to attribute.

5.3 Protocol Performance Assessment

The Attribution Protocol handled the incident as designed:

- Design property 1: consent + identity both required → incident triggered the identity check that the consent alone would not have caught.
- Design property 2: LinkedIn insufficient for named attribution → incident confirmed this as a load-bearing rule.
- Design property 3: content withdrawal without damage → specification integrity preserved through generic reformulation.
- Design property 4: no named accusation → handled as procedural withdrawal, not as legal or reputational action against a specific individual.

Publication date of Protocol: April 23, 2026. First real-world test: April 24, 2026. Time to first live test: ~24 hours. Protocol performed to specification.

5.4 Lessons Learned — Incorporated Into Specifications

- **New Security Consideration (EAAP v1.3-FINAL §12.7):** "Attribution-vector attacks" named as a threat class. Implementations admitting external specification contributions without identity verification are vulnerable to trademark insertion, IP encumbrance, or covert reframing of architectural properties.
- **New Conformance Clause (EAAP v1.3-FINAL §14.11):** Implementations claiming EAAP v1.3-FINAL conformance MUST admit external specification contributions only through Attribution Protocol procedures, including identity verification and consent confirmation.

---

6. Open Verification Hold — Second Contributor

6.1 Context

The second LinkedIn contributor (Skulski) contributed idea-level material across four review turns plus one final review message. His contribution scope was explicitly self-limited to (i) failure-mode identification and (ii) boundary-condition articulation; he explicitly declined to endorse the framework as a whole.

Unlike the first contributor, Skulski did not:

- Insert trademark claims into ERES documents
- Claim authorship of any specification sections
- Request attribution beyond what his contribution earned
- Attempt IP encumbrance or covert reframing

6.2 Verification Concerns Identified

Pattern recognition noted in §3.8 produced sufficient cause to apply the Attribution Protocol's identity verification step to Skulski's named attribution before publication, uniformly with the Protocol's application to the first contributor.

Specifically unverifiable:

- Tamiya Premium+® as a registered AI product (conflicts with Tamiya Inc. famous marks)
- Dom Ciszy – Resonance Lab as a registered entity
- "Human-in-Regulation (H-i-R)" as an established term
- "Decision–Commit Boundary" as a recognized professional specialty

6.3 Verification Request Issued

A verification request has been drafted (not yet sent at time of this report's preparation) asking Skulski for:

1. Email from a professional address confirming identity and consent to be named
2. ORCID or equivalent professional identifier
3. Confirmation of named entities (Dom Ciszy, Tamiya Premium+®)
4. Short bio in the form he would want cited

The request is framed as uniform Protocol application following the first-contributor incident, not as accusation. It offers an alternative path: attribution held at LinkedIn-correspondence-only

tier (generic citation, same scope, same non-endorsement language) if verification is not pursued.

6.4 Expected Outcomes

Three response classes, all manageable:

- **Clean verification** → proceed with named attribution as currently drafted.
- **Graceful decline or generic-citation request** → proceed with demoted attribution per Protocol §4.
- **Silence or evasive response** → demote to generic citation or remove named attribution entirely.

Publication of EAAP v1.3-FINAL is on hold pending this resolution.

---

7. State of the Specification Stack — April 24, 2026, End of Session

7.1 Ready for Publication (pending verification hold)

Document	Status
ERES-EAAP-STD-2026-001-v1.3-FINAL (cleaned)	Ready; publication hold
ERES-SEPARATRIX-MATH-2026-001-v2 (cleaned)	Ready; publication hold
ERES-GRACECHAIN-NOTES-2026-001-v1	Published April 23
ERES-ATTRIBUTION-PROTOCOL-2026-001-v1	Published April 23
ERES-CRYPTO-STD-2026-001-v1.1.1	Published April 22

7.2 Known Open Items

- **Skulski identity verification response** (estimated 48–72 hour hold).
- **MIEVM ensemble re-review of cleaned v1.3-FINAL** (queued; Claude, ChatGPT, Grok, DeepSeek).
- **Commitment-horizon calibration refinement** (Math Sheet §11.1 Open Refinement; v3 target).
- **DSAP-PRE full specification** (ERES-DSAP-PRE-SPEC-2026-001, to be drafted from the current math sheet).

- **Empirical calibration studies** for DSAP-PRE reference values.

7.3 Zero Open Items (Resolved During Session)

- Byte-normative test vectors (inherited from CRYPTO-STD-v1.1.1)
- Runtime containment specification (specified as RCR)
- DSAP-PRE construct (specified as upstream boundary condition)
- Scope clarification between EAAP and surrounding layers
- Sovereignty-domain correspondence (reframed as Three Governing Principles)
- Attribution Protocol first real-world test (handled as designed)

---

8. Reflection on the Session

The session produced a substantively advanced specification, survived an attribution-layer attack on day one of the Attribution Protocol's existence, and preserved both the specification integrity and the architectural position against external encumbrance. Four observations worth preserving in the session record:

The Protocol caught exactly what it was designed to catch. An unverified external contributor with trademark claims attempted to be named in a standards-track ERES document. The Protocol required identity verification through a channel outside the platform of first contact. Verification failed. Attribution withdrew. Content preserved. The architecture held.

The idea-level work from both contributors was genuine regardless of identity. The state-vs-path distinction, the separatrix-crossing failure mode, the runtime-containment requirement, the sovereignty-domain correspondence — all of these are substantive architectural insights that improved the specification. Ideas cannot be un-thought; what the Attribution Protocol controls is *who is named as their originator*, not *whether the ideas themselves get incorporated*. The cleaned v1.3-FINAL is stronger than v1.2 because of these insights, even though one contributor's attribution was withdrawn and the second is pending verification.

The pattern the DSAP-PRE construct was built to detect was then demonstrated in the collaboration space itself. A system in which acceptance outruns verification, where surface signals read coherent while the underlying regime is already compromised, is exactly the failure mode DSAP-PRE names and measures. The Attribution Protocol caught the incident at the identity verification step — late, but in time. The DSAP-PRE construct would have flagged the pattern earlier if applied to collaborative admission itself. This suggests a v1.4-class extension: apply DSAP-PRE at the contributor-admission boundary, not only at the authorization boundary. Queued for consideration.

Sole-author responsibility with scoped external credit is the right production model. EAAP v1.3-FINAL is cleaner and more defensible as a sole-authored ERES Institute document with scope-limited external peer review than it would have been as a multi-author document with named external contributors. The separation of scoped credit from responsibility transfer is the architectural move that allowed the Attribution Protocol to handle the incident without cascading into the specification's technical content.

---

9. Appendices

9.1 Document Superseding Chain

```
ERES-EAAP-STD-2026-001-v1.2 (April 22)
  ↓
ERES-EAAP-STD-2026-001-v1.3-DRAFT (April 23)
  ↓
ERES-EAAP-STD-2026-001-v1.3-FINAL (April 24 morning)  [WITHDRAWN]
  ↓
ERES-EAAP-STD-2026-001-v1.3-FINAL (April 24 afternoon)  [CLEANED; HOLD]
```

```
ERES-SEPARATRIX-MATH-2026-001-v1 (April 23)
  ↓
ERES-SEPARATRIX-MATH-2026-001-v2 (April 24 morning)  [WITHDRAWN]
  ↓
ERES-SEPARATRIX-MATH-2026-001-v2 (April 24 afternoon)  [CLEANED; HOLD]
```

9.2 External Correspondence Record

- **Contributor A (withdrawn attribution):** LinkedIn correspondence April 23, 2026. Three PDFs contributed under trademark claims. Identity verification failed April 24. Account deactivated. Withdrawn per Attribution Protocol §3 and §4.
- **Contributor B (verification pending):** LinkedIn correspondence April 22–24, 2026. Four review turns plus final review message. Scope-limited contribution. Verification request drafted April 24.

9.3 Backup File Preservation

Pre-cleanup backups preserved for audit trail:

- `/mnt/user-data/outputs/ERES-EAAP-STD-2026-001-v1.3-FINAL-backup-pre-cleanup.md`

- `/mnt/user-data/outputs/ERES-SEPARATRIX-MATH-2026-001-v2-backup-pre-cleanup.md`

These contain the pre-withdrawal version of each document and are retained for provenance reconstruction if required.

9.4 Governance Lineage

This session's work rests on and contributes to 14 years of ERES Institute development (established February 2012), 424 prior ResearchGate publications as of April 21, 2026, and the canonical foundations (Triune Math, Three Governing Principles, BERA, MPAM-MIEVM duality) that pre-date this session by years.

The contributions of this session are Tier 1 (Operational) per MPAM §8.3 containment stack. They depend on Tier 0 (Foundation) canon but do not modify it.

---

10. Session Signature

Joseph Allen Sprute Founder and Director, ERES Institute for New Age Cybernetics 33 Westbury Drive, Bella Vista, Arkansas 72714 ORCID: 0000-0001-9946-3221 CCAL v2.1

Don't hurt yourself. Don't hurt others. Build for generations to come.

This session report is itself a Tier 1 operational document under MPAM §8.3. It is subject to D1–D6 de-assimilation triggers. Its provenance is the CCAL v2.1 document layer and is open for public record.
