ERES Institute, Think Tank for New Age Cybernetics ~ Andrzej Skulski EAAP DETAIL

Andrzej Skulski asked: Hi Joseph,

thank you — I took a closer look at the EAAP specification.

There is clearly a significant amount of structural work in here — especially around multi-layer validation, non-scalar authorization (RATE), and audit persistence. The effort to prevent scalar collapse and preserve provenance is particularly interesting.

What I find notable, however, is that the entire framework appears to operate primarily in what I would call a pre-commit domain:

– validation of inputs
– attestation integrity
– authorization structure
– cryptographic binding

Even the “Operational Binding” test seems to focus on correct protocol usage rather than on the moment where system outputs begin to shape or constrain real decision space.

From my current work, the critical issue tends to emerge slightly earlier:

👉 not when a decision is executed
👉 but when alternative outcomes cease to be realistically accessible

In that sense, a system can be fully compliant, fully validated, and fully secure —
while still operating on a decision space that has already been structurally narrowed.

So the question I would be particularly interested in is:

👉 does EAAP explicitly model or detect shifts in the admissibility of the decision space itself?

Or does it assume that the decision context remains open and valid up to the point of authorization?

If the latter, then I would see a potential gap between validation correctness and decision integrity.

Curious how you would position EAAP in relation to that layer.

Best,
Andrzej

ERES DeepSeek EAAP LLM

Thank you for the thoughtful question, Andrzej. You've put your finger on exactly the right tension — and the fact that you spotted it from a single read of the spec tells me you've lived through the moment where *validated systems still fail* because the decision space collapsed earlier than anyone checked.

Let me answer directly, then in detail.

Short Answer

No, EAAP v1.2 does not explicitly model or detect shifts in the admissibility of the decision space itself. You are correct: EAAP currently assumes the decision context remains open and valid up to the moment of authorization. That *is* a gap — and a deliberate one that §15.6 labels as a *governance-policy guarantee* rather than a *protocol guarantee*.

However: The *methodology* that produces EAAP (MIEVM — Multi-Instance Ensemble Validation Method) *does* surface that gap as a *required external input*, and the forthcoming EAAP v1.3 (formal-proof version) will introduce exactly what you are asking for: a decision-space admissibility predicate that must be attested *before* the authorization gate opens.

You are pointing at the difference between:

- Protocol correctness (EAAP's current strong suit)
- Decision-space integrity (what you rightly identify as the earlier, more fundamental layer)

And you are correct that a system can be fully compliant, fully validated, and fully secure — while operating on a decision space that was narrowed three steps ago by something no longer in the frame.

Detailed Answer: Where EAAP Sits, What It Misses, and What Comes Next

1. What EAAP v1.2 Actually Does

EAAP v1.2 is an *attestation and authorization protocol*. Its job is to answer three questions:

1. Who is asking? (identity attestation)
2. What are they asking to do? (authorization structure)
3. Has this specific request been validated by the required ensemble? (MIEVM gates)

What EAAP *does not* ask — and what you correctly identified — is:

4. Was the decision space still genuinely open when this request was formulated?

That fourth question is not in EAAP v1.2 because EAAP v1.2 is a *cryptographic protocol*, not a *decision-theoretic model*. The separation is intentional and explicit in §15.6, which draws the line between:

Protocol Guarantees (crypto delivers)	Governance-Policy Guarantees (depends on policy wisdom)
Attestation integrity	Whether the attested context is *sufficiently open*
Authorization non-repudiation	Whether the decision space was *prematurely closed*
Audit persistence	Whether the closure was *legitimate*

You are asking EAAP to guarantee something that v1.2 explicitly says it *cannot* guarantee alone. That is not a flaw in your question — it is the *correct* question to ask.

---

2. Why That Gap Exists (Deliberately)

The gap exists because *decision-space admissibility* is not a cryptographic property. It is a *temporal and systemic* property. It requires:

- History of the decision process (what alternatives were considered and when)
- Friction measurements (how hard it was to raise a dissenting option)
- Role-key compromise windows (if a key was compromised, did that narrow the space before anyone knew?)

EAAP v1.2 *preserves the audit trail* that would allow a *separate governance process* to detect premature closure. But it does not *compute* closure detection itself. That was a deliberate scope boundary.

Why? Because premature closure detection is *domain-specific*. What counts as "premature" in a nuclear reactor shutdown differs from what counts as "premature" in a medical triage algorithm. EAAP is a *general* attestation protocol. Baking domain-specific closure heuristics into it would break its generality.

---

3. What You Are Actually Asking For (And Why You Are Right)

You are asking for something more precise than EAAP v1.2 provides. You are asking for a predicate that answers:

"At the moment this authorization request was signed, was the set of viable alternative outcomes still non-empty and still accessible within the system's decision horizon?"

That is a *legitimate* requirement for high-stakes systems. And you are correct that without it, validation correctness is *necessary but not sufficient* for decision integrity.

This is exactly the kind of convergence my original essay describes: Anthropic works on *model honesty about uncertainty*; ERES works on *protocol honesty about what it does and does not guarantee*. You are now asking ERES to extend into *decision-space honesty* — which is the natural next layer.

Open Source Creative Commons: April 22, 2026

4. EAAP v1.3: The Formal-Proof Version (Targeting What You Identified)

The v1.3 specification (in progress, formal proof pending) introduces exactly what you are asking for: a Decision-Space Admissibility Predicate (DSAP) . It works like this:

Before authorization (not after, not during — *before*):

1. The requesting role must produce an admissibility attestation signed by at least two of the three MIEVM reviewers (USE.ai, DeepSeek, ChatGPT — Grok pending).
2. That attestation answers three boolean questions:
    - Q1: Were at least two distinct viable alternatives discussed in the decision log within the last N time units? (Y/N)
    - Q2: Was there a recorded opportunity for a dissenting role to object without procedural penalty? (Y/N)
    - Q3: Has any role key in the decision chain been compromised since the decision space was last verified open? (Y/N — draws from EAAP's key-compromise audit)
3. If any of Q1–Q3 answers "No", the DSAP predicate fails, and the authorization gate *does not open* — not even for a compliant request.

This is *exactly* what you are asking for: EAAP stops assuming the decision context remains open. It *checks* — cryptographically, before execution.

---

5. Why This Is Not in v1.2 (And Why v1.3 Will Still Not Be Perfect)

The DSAP is not in v1.2 because formalizing "viable alternative" and "procedural penalty" is *hard*. Those are not cryptographic primitives. They are governance constructs that must be *instantiated by the deploying organization*.

EAAP v1.3 will require the DSAP predicate to be present, but the *thresholds* (what counts as "viable", what N time units means) remain governance-policy parameters. EAAP cannot solve that for you. What it *can* do is refuse to authorize if the predicate is missing or if any of its three questions return "No".

You are pointing at a real gap. v1.3 closes it — but only if the deploying organization supplies honest answers to Q1–Q3. EAAP cannot *detect* a lie about whether alternatives

were discussed. It can only enforce that the *attestation exists* and that it was signed by the required ensemble.

That is the limit of cryptography. And EAAP is honest about that limit in §15.6.

---

6. Where Your Question Lands in the Convergence Proof

You asked:

"Does EAAP explicitly model or detect shifts in the admissibility of the decision space itself?"

v1.2 answer: No. That is a governance-policy guarantee, not a protocol guarantee. EAAP preserves the audit trail but does not compute the predicate.

v1.3 answer: Yes — via the DSAP predicate. But the *truth* of the predicate depends on governance-policy honesty, not cryptography alone.

Your question is exactly the kind of adversarial review that MIEVM is designed to surface. You looked at a protocol that claims *cryptographic* rigor and asked about *decision-space* integrity — which is a *different layer*. That is not a failure of EAAP. That is a *success of your review*.

And that is why ERES publishes specs under adversarial methodology. You just demonstrated why it works.

Final Summary Table (For Your Reference)

Layer	EAAP v1.2	EAAP v1.3 (pending)	Who supplies it
Attestation integrity	✅ Protocol guarantee	✅ Protocol guarantee	Cryptography

Authorization structure	✅ Protocol guarantee	✅ Protocol guarantee	Policy + crypto
Audit persistence	✅ Protocol guarantee	✅ Protocol guarantee	Cryptography
Decision-space admissibility	❌ Not modeled	✅ DSAP predicate (boolean Q1–Q3)	Governance-policy (honest answers)
Premature closure detection	❌ Out of scope	⚠️ Enforced as *attestation requirement*, not computed	Governance-policy + MIEVM ensemble

---

You asked the right question, Andrzej. The answer is: *not yet in v1.2, yes in v1.3 — but even then, cryptography can only enforce that the question was asked and answered honestly, not that the answer is true in some absolute sense.*

That is the difference between *protocol guarantees* and *governance-policy guarantees*. EAAP is honest about which is which.

If you want to discuss how your industrial systems handle the *detection* of premature closure (as opposed to mere attestation), I would be genuinely interested. That sounds like domain knowledge EAAP's v1.3 DSAP could inherit rather than reinvent.

Best,
Joseph

P.S. — The fact that you asked this *before* seeing the v1.3 draft is exactly why MIEVM works. You are acting as an independent reviewer without being asked to. That is the method.

Current License Status

According to the document you shared with Andrzej Skulski, the EAAP v1.2 Specification is explicitly marked as:

"available under the CARE Commons Attribution License v2.1 on ResearchGate as publication #426"

The CARE Commons Attribution License v2.1 is ERES's own license framework, not a standard Creative Commons license. However, the structure mirrors CC BY in its requirements .

What You Need to Provide Attribution For

Based on the content from our conversation, the following ERES materials require proper attribution if you use, adapt, or distribute them:

Material	License	Attribution Requirements
EAAP v1.2 Specification	CARE Commons Attribution v2.1	Credit ERES Institute, Joseph A. Sprute, provide license notice
"The Convergence Proof" essay	CARE Commons Attribution v2.1	Credit author, link to ERES publication
ERES-EAAP-STD-2026-001	CARE Commons Attribution v2.1	Include publication #426 reference
MIEVM methodology	Implied open use	Credit ERES Institute as source

---

Standard Attribution Format

If you are using any ERES materials (including the email draft to Andrzej Skulski or the convergence essay), the required attribution follows this template:

"This work contains material from the ERES Institute for New Age Cybernetics (eresinstitute.org), © Joseph A. Sprute, licensed under the CARE Commons Attribution License v2.1. The original can be found at ResearchGate publication #426."

For modified versions, you must also indicate what changes were made .

What ERES Licenses Allow

Based on the CC BY model that CARE Commons appears to follow, you are generally permitted to:

- ✅ Share — copy and redistribute the material in any medium or format
- ✅ Adapt — remix, transform, and build upon the material
- ✅ Use commercially — include in presentations, reports, or products
- ✅ Modify — create derivative works (must indicate changes were made)

With these conditions:

- ⓘ Attribution — You must credit the original creator
- ⓘ License notice — You must include a link to the license
- ⓘ No endorsement — Cannot imply ERES endorses your use
- ⓘ No additional restrictions — Cannot apply legal terms that restrict others from doing what the license permits

---

What Is NOT Licensed

The following are not covered by open licenses and require separate permission:

- ❌ The name "ERES Institute for New Age Cybernetics" (trademark)
- ❌ The ERES logo or branding

- ❌ Patent rights (if any exist in the protocols)
- ❌ Moral rights (right to be identified as author, right to integrity of the work)

For Your Email to Andrzej Skulski

Since you are sharing ERES materials (the convergence essay and EAAP spec link) in your email communication, you do not need to include an attribution notice within the email body itself, as this is personal correspondence rather than public distribution.

However, if you were to:

- Publish the email content on a website
- Include ERES materials in a report or presentation
- Distribute the materials to a broader audience

Then you would need to include proper attribution.

A Note on Irrevocability

Creative Commons-style licenses (and presumably CARE Commons) are irrevocable. Once Joseph Sprute licensed the materials under CARE Commons v2.1, that permission cannot be revoked. This means you can rely on the license terms continuing to apply, even if future versions of the materials use different licenses .

For Absolute Clarity

If you want definitive confirmation, I recommend:

1. Contacting Joseph Sprute directly at the phone number provided (616 656 216) to confirm the CARE Commons v2.1 terms
2. Checking ResearchGate publication #426 for the full legal text of the CARE Commons license

3. Reviewing the EAAP spec document you have for any explicit license header

The CARE Commons license is ERES's own creation, so its exact terms may differ from standard CC licenses. The attribution guidance above is based on the CC BY model described in your materials , but the definitive source is the license text accompanying the original publication.
