1. The Core Question

> *What does a human settlement need — at minimum — to survive with zero external dependency?*

This question is the origin point of the ERES Institute's fourteen-year research program and the foundation of the 1000-Year Future Map. It is not a thought experiment. It is an engineering specification. Every technology, governance protocol, education curriculum, economic instrument, and measurement standard developed under the ERES architecture is tested against this single constraint: does this system close its loop without external dependency?

The answer produces an unexpected finding: the component list for planetary survival is identical at every scale. Whether the settlement is a quarter-acre homestead in Bella Vista, Arkansas, a Solid-State Smart-City, a lunar outpost, or an interstellar generation ship, the categories of required closure are the same. Only the parameter values change. The engineering is parametric, not architectural. The design pattern is fractal.

This paper presents the convergence architecture that produces this finding — the bidirectional meeting point between bottom-up infrastructure engineering and top-down civilizational trajectory planning — framed within PlayNAC (New Age Cybernetic Game Theory), which is the master simulation and governance engine containing all operational subsystems: EarnedPath for merit-based human development, GERP for planetary resource coordination, GAIA SOMT for the sociocratic metadata layer, VERTECA for multi-domain verification, Meritcoin and GraceChain for the economic engine, the Graceful Contribution Formula for merit quantification, NBERS for civilizational accounting beyond GDP, and BERA for the biometric measurement layer that keeps every system empirically grounded.

2. PlayNAC: The Master Architecture

PlayNAC (New Age Cybernetic Game Theory) is not one component among many. It is the master simulation and governance engine within which every other ERES component operates. PlayNAC translates complex civilizational coordination into participatory, game-theoretic engagement — making governance accessible, measurable, and self-correcting. Where traditional governance imposes decisions top-down, PlayNAC creates incentive structures where cooperation yields higher fitness returns than defection, making the ethical choice and the strategic choice identical.

PlayNAC contains three primary subsystems that form its operational core: EP (EarnedPath) for human resource development and credentialing, GERP (Global Earth Resource Planning) for planetary resource coordination, and SOMT (Sociocratic Overlay Metadata Tapestry) for the metadata-first coordination layer. These three subsystems are supported by VERTECA for verification, Meritcoin/GraceChain/GCF for economic mechanics, NBERS for civilizational accounting, and BERA for empirical measurement.

2.1 PlayNAC: EP GERP SOMT — The Operational Triad

The three words after PlayNAC are not accessories — they are the triad that makes PlayNAC operational:

Component	Full Name	Role Within PlayNAC
EP (EarnedPath)	Merit-Based Progression	The human development engine. EP = CPM × WBS + PERT. Critical Path Method for sequencing skill acquisition, Work Breakdown Structure for decomposition, Program Evaluation and Review Technique for realistic scheduling. Human capability IS the primary resource (R in C=R×P/M). EP ensures every participant can demonstrate real competency, not just credentials. On a generation ship, EP ensures every generation is at least as capable as the one before.
GERP	Global Earth Resource Planning	The planetary coordination engine. GERP manages resource flows through Vacationomics frameworks — balancing productive labor, regenerative leisure, and ecological restoration. GERP occupies the denominator (M in C=R×P/M): institutional overhead to be minimized. GERP succeeds by becoming invisible. On a generation ship, GERP manages the closed material economy where every atom is accounted for.
SOMT	Sociocratic Overlay Metadata Tapestry	The coordination nervous system. SOMT creates a tapestry of interconnected sociocratic circles from household to planetary scale with consent-based decision-making and bio-energetic accountability. Metadata-first architecture: relationships, consents, and bio-energetic states are primary data, governance actions emerge as

		consequences. On a generation ship, SOMT IS the governance fabric.

2.2 GAIA: The Planetary Intelligence

GAIA (Global Actuary Investor Authority) is the planetary intelligence system within which SOMT operates. GAIA provides the brain; SOMT provides the nervous system. The enablement chain is precise: SECUIR (Silent Energy Circular Universe Infinite Rotation) establishes security clearance and integrity verification, which enables GEAR (Global Earth Applications Recorder), which enables NRP (Natural Resonance Processing). This SECUIR → GEAR → NRP progression ensures planetary-scale recording is gated by verified participant integrity before advanced resonance-based computation is unlocked.

> *GAIA is the brain. SOMT is the nervous system. The twelve closure systems are the organs. The THOWs are the cells. The generation ship is the body at maximum scale.*

2.3 VERTECA: The Verification Layer

VERTECA (Verification, Evaluation, Rating, Trust, Efficacy, Compliance, Accountability) operates within PlayNAC as the constitutional enforcement mechanism. VERTECA ensures PlayNAC governance decisions conform to the Three Governing Principles, EarnedPath credentials reflect real competency, GERP allocations serve planetary health, and SOMT metadata represents ground truth. Non-punitive: non-compliance triggers education through EarnedPath, not punishment. On a generation ship with no external court of appeal, VERTECA IS the rule of law.

Domain	Function Within PlayNAC
Verification	Confirms claims correspond to reality. Bio-electric verification through BERA sensors; cryptographic verification through GraceChain.
Evaluation	Assesses performance against BEST/SOUND/GOOD criteria — resonance-spectrum measurement against the Three Governing Principles.
Rating	CyberRAVE's 72 Key Domain system. Transparent, multi-dimensional, Abolishing Veiled Exchanges.
Trust	Accumulated through verified contribution over time, not granted by authority. GraceChain provides the immutable trust ledger.
Efficacy	Feedback loop between intention and result. BERA provides the empirical efficacy signal.
Compliance	Constitutional conformance with the NAC. Non-punitive: triggers EarnedPath remediation.
Accountability	Intergenerational. Every decision on GraceChain is auditable by future generations. RCI measures persistence across generational transitions.

3. The PlayNAC Economic Engine: Meritcoin, GraceChain, GCF, and NBERS

3.1 Meritcoin: Proof-of-Resonance

Meritcoin is PlayNAC's native currency. It operates on Proof-of-Resonance — not Proof-of-Work. Where Bitcoin rewards computational expenditure, Meritcoin rewards demonstrated contribution to ecological and social coherence. The four BERA metrics (ARI, ERI, RHC, RCI) feed directly into Meritcoin value accrual as a closed feedback loop: ethical and ecological harmony IN, economic value OUT. It is not mining — it is tuning.

Meritcoin yield multipliers scale with EarnedPath credential level: 1.0x at pre-SSSC baseline, 1.5x at TETRA 101 (Foundations), 2.0x at 201 (Measurement), 3.0x at 301 (Integration), and 5.0x at CERT:TETRA-FULL (401 Advanced). The multiplier measures output capacity, not privilege.

3.2 GraceChain: The Immutable Contribution Ledger

GraceChain is the blockchain underlying the entire PlayNAC economy. Every Meritcoin minting event, EarnedPath credential, VERTECA verification, PlayNAC governance decision, and SOMT metadata snapshot is cryptographically hashed and immutably recorded. GraceChain serves five structural functions: trust ledger for VERTECA, credential registry for EarnedPath, transaction rail for Meritcoin, consent record for SOMT, and accountability archive for the 1000-Year Future Map.

On a generation ship, GraceChain ensures the arriving crew can audit every decision made by every previous generation. Intergenerational accountability is not an aspiration — it is an engineering specification enforced by cryptographic immutability.

3.3 The Graceful Contribution Formula (GCF)

$$GCF = \Sigma[Contribution_i \times Impact_i \times Sustainability_i \times Verification_i]$$

The GCF is PlayNAC's computational heart — the algorithm translating human action into measurable merit value. Contribution identifies the action type (ecological restoration, community service, learning, bio-alignment, innovation). Impact measures the effect on system health (0–1) through BERA sensor data. Sustainability evaluates whether the contribution regenerates or depletes. Verification confirms it actually occurred through VERTECA and GraceChain.

The integration chain: ARI/ERI sensors → GCF calculation → Meritcoin minting → GraceChain recording → UBIMIA distribution → NBERS compliance check. GCF scores above threshold trigger Meritcoin minting. Continuous scoring enables real-time non-punitive feedback: contributors see resonance impact immediately, creating a virtuous cycle.

3.4 NBERS: Replacing GDP

$$NBERS = UBIMIA \times \Sigma(GCF_i \times PERC_i) + [BERC \cdot JERC]$$

NBERS (National Bio-Ecologic Resource Score) replaces GDP as civilizational accounting. Where GDP measures production volume regardless of consequence — increasing from disasters, disease, and destruction — NBERS measures actual outcomes: health, ecological coherence, resource sustainability, and equitable distribution. NBERS cannot be gamed by externalizing costs because the BERA measurement layer detects externalities in real time.

The formula integrates three layers. UBIMIA (Universal Basic Income Merit Investment Awards) provides the baseline social contract. The GCF-PERC summation (Graceful Contribution Formula times Personal Environmental Rating Codex) measures merit-weighted contribution across the 72-dimensional SCC vector. The BERC-JERC product (Bio-Ecologic Ratings Codex times Justice-Ethics Resonance Codex) provides ecological and ethical correction factors preventing economic activity from decoupling from planetary health.

NBERS establishes HARMONY at the economic layer: a civilization-scale harmonic analysis serving as the power spectrum of human contribution to planetary coherence. On a generation ship, NBERS measures whether the closed economy maintains or degrades the vessel's ecological and social health across generational time.

4. Measurement: BERA Resonance Index Architecture

BERA (Bio-Electric Resonance Architecture) is PlayNAC's measurement layer — the empirical foundation that prevents the system from becoming aspirational rather than testable. Four resonance indices form a closed feedback loop feeding GCF, Meritcoin, and NBERS:

Index	Full Name	Function
ARI	Aura Resonance Index	Individual bio-electric coherence relative to environment. Measured via ERES Kirlianography optics and Ship's Mate wearable sensors. Personal health baseline feeding GCF Contribution and Impact variables.
ERI	Emission Resonance Index	System-level energy emission patterns of communities, infrastructure, and ecosystems. Environmental health baseline feeding NBERS through BERC.
RHC	Resonant Harmony Cycle	Cyclical biological processes as resonance phenomena (circadian, menstrual, seasonal). BEC Architecture formalizes the menstrual cycle as an RHC disrupted by sugar metabolism dysfunction.
RCI	Resonant Continuity Index	Intergenerational: RCI = P_Ω_norm × ARI_sys × VibConst. Measures architectural coherence across generations — the metric that matters on a ship where arriving crew is not departing crew.

These feed into the PBJ Tri-Codex (PERC × BERC × JERC), the comprehensive rating system integrating personal, bio-ecologic, and justice-ethics dimensions. PERC measures individual ecological alignment through the 72-dimensional SCC vector. BERC measures environmental impact. JERC provides the equity correction. The PBJ product feeds NBERS, completing the chain from individual bio-electric measurement to civilizational accounting.

At S6 (interstellar), the Schumann Resonance (~7.83 Hz) reference is replaced by the ship's engineered electromagnetic ground state — a designed Schumann-equivalent maintained by SECUIR.

5. Bottom-Up: Engineering Closure at the Smallest Viable Unit

5.1 The VLSA Principle

> *If it works in a THOW, it works on a generation ship. If it breaks on a generation ship, it was broken in the THOW.*

The THOW (Tiny House on Wheels) is not a lifestyle choice. It is a test article for a generation ship. Every system that must function on an interstellar vessel can be prototyped, tested, and validated at THOW scale. The species does not need to build a generation ship. It needs to build THOWs. Millions of them.

5.2 The Four BEE Infrastructure Technologies

Code	Full Name	Function and Scale Identity
THOW	Tiny House on Wheels	Modular habitat. Crew quarters on the ship. Energy-positive, water-recycling, waste-processing. The irreducible unit.
HFVN	High-Frequency Vibration Network	Communications backbone. Mesh at THOW scale, deep-space retransmission at S6. Carries Storm Party emergency protocol.
FDRV	Fly & Dive RV	“Spaceship Economy” closed-loop transport. At S0: personal vehicle. At S6: FDRV IS the interstellar vessel itself. Most consequential VLSA finding.
GSSG	Self-Healing Structures	Hull architecture. Sugar-Carbon Reservoir Hypothesis for self-repair. Ship’s hull is GSSG at maximum scale.

5.3 The Twelve Closure Systems

Zero external dependency at every scale. All twelve validated S0 through S6 in the 91-test suite:

#	System	Component	Closure Mechanism
1	Energy	SECUIR	Closed thermodynamic cycle at all scales. Gates SECUIR → GEAR → NRP enablement chain.
2	Materials	GSSG	Self-healing fabrication; carbon-reservoir recycling; zero-waste loop.
3	Services	GunnySack	Guaranteed User-group Network Nullifying Yieldless Service: Accredited Certified Knowledge.
4	Validation	CyberRAVE	72 Key Domains; Cybernetic Ratings Abolishing Veiled Exchanges.
5	Ratings	BERA	ARI, ERI, RHC, RCI. Feed Meritcoin via GCF. Feed NBERS via PBJ Tri-Codex.
6	Interface	Talonics	452-element symbol matrix; gestural computing.

7	Cognition	ERES Core	C=R×P/M; morally vectored toward BEST/SOUND/GOOD.
8	Governance	PlayNAC/VERTECA	Sociocratic protocols via SOMT; VERTECA verification; non-punitive compliance via EarnedPath.
9	Currency	Meritcoin/GraceChain	Proof-of-Resonance via BERA → GCF → Meritcoin → GraceChain. “Not mining — tuning.”
10	Identity	IDIPITIS	Four-layer crypto identity: hash, biometric (FAVORS), BEST anchor, time-lock.
11	Privacy	FAVORS	Bio-electric auth; locally verified; no external DB.
12	Emergency	Storm Party	Retransmission via HFVN; autonomous triage; no external logistics.

5.4 FDRV IS the Ship

The ship is a FDRV. Crew quarters are THOWs. Communications is HFVN. Hull is GSSG. Energy is SECUIR. Governance is PlayNAC through VERTECA. Ratings are CyberRAVE. Services are GunnySack. R&D is SaleBuilders. Intelligence is ERES. Credentialing is EarnedPath. Resource coordination is GERP. The nervous system is GAIA SOMT. Economy runs on Meritcoin over GraceChain, scored by GCF, accounted by NBERS, measured by BERA. Everything the ship needs already exists. It needs to be built bigger.

6. Top-Down: The 1000-Year Future Map

6.1 The Map as Constraint Function

The 1000-Year Future Map is a constraint function, not a prediction. Every decision is tested: does this move toward or away from the trajectory defined by the Three Governing Principles? Don't hurt yourself. Don't hurt others. Build for generations to come. Technologies that cannot scale to interstellar fail the VLSA test. Governance that requires external authority fails the closure test. Economics requiring perpetual growth in finite systems fails the thermodynamic test.

6.2 Temporal Architecture

Era	Period	Phase	Milestones
Century 1	2025–2125	Planetary Unification	THOW/Smart-City pilots; BERA coverage 80%; Meritcoin economy; NBERS replacing GDP; border dissolution; space elevator; Earth-Moon zone; self-sufficient Mars colony
Centuries 2–3	2125–2325	Solar System	Mars terraforming; asteroid mining; Venus cloud cities; Dyson swarm 1% capture; GraceChain interplanetary
Centuries 4–6	2325–2625	Stellar Mastery	Dyson swarm 25%; interstellar probes 0.1c; fusion universal; zero poverty in solar system; GERP managing system-wide resource flows
Centuries 7–10	2625–3025	Interstellar	Colony ships (macro-FDRVs); galactic colonization; all twelve closure systems at S6; EarnedPath across transit generations; GraceChain across light-years

6.3 PlayNAC Victory Conditions

PlayNAC defines abundance victory — not defeating opponents but achieving civilizational milestones. Bronze Age (2050): universal needs, zero starvation, renewables above 80%. Silver Age (2150): post-scarcity, voluntary work, space elevator. Golden Age (2500): Dyson swarm 10%, asteroid belt industrialized, no poverty in the solar system. Diamond Age (3025): interstellar colony ships, galactic colonization wave. Each victory unlocks the next era's engineering challenges. The civilization earns access by solving closure at the current scale.

6.4 GERP as Top-Down Resource Coordination

GERP is the top-down counterpart to EarnedPath's bottom-up credentialing. Where EarnedPath develops human capability, GERP coordinates planetary resource flows through AI-enhanced ecological monitoring (via GAIA), Vacationomics frameworks, and real-time BERA data. The REEPER protocol (Relative Energy Equal Pay Emergency Room) converts all needs to energy equivalents, creating a physics-based economy. GERP occupies the denominator in C=R×P/M

— Method to be minimized. On a generation ship, GERP manages the closed material economy where every atom is accounted for without burdening the crew with bureaucratic overhead.

7. The Convergence Point

7.1 Collecting the Components for a New Planet

The convergence — where bottom-up engineering meets top-down trajectory planning — is discovered when you list everything a settlement needs to survive with zero supply chain. Energy generation. Water cycling. Food production. Materials fabrication. Medical systems. Governance. Education. Identity management. Emergency response. Communications. Privacy. Economic exchange.

Now list the same for a homestead in Arkansas. Identical. The component list does not change between scales. 91 validated tests across 7 scales (S0–S6) confirm every closure system functions at generation-ship scale with parameter substitution only.

> *The component list is identical. The engineering is parametric, not architectural. The design pattern is fractal.*

7.2 The Seven-Scale Validation Matrix

Scale	Name	Physical Form	Closure Characteristics
S0	Personal	THOW	Individual closed-loop habitat; personal BERA; sovereign identity via IDIPITIS
S1	Family	THOW Cluster	2–10 persons; shared energy/water; internal PlayNAC governance
S2	Community	THOW Village	50–500 persons; GunnySack services; CyberRAVE validation; Meritcoin circulation
S3	Municipal	Solid-State Smart-City	10K–1M persons; full BEE; PlayNAC/VERTECA governance; NBERS accounting; GraceChain operational
S4	Regional	Smart-City Network	Multi-city; GERP environmental monitoring; regional SECUIR grid; SOMT coordination
S5	Planetary	Global	GAIA SOMT overlay; 1000-Year Future Map active; Earth-Moon zone; NBERS replacing GDP globally
S6	Interstellar	Generation Ship	Macro-FDRV; zero external dependency; all twelve closures; EarnedPath across generations; GraceChain as civilizational memory

7.3 Bidirectional Processing

Bottom-up/top-down processing is a formal engineering methodology within PlayNAC. A homesteader's energy closure (bottom-up) is constrained by the Future Map's requirement for interstellar-viable energy (top-down), which shapes which technologies receive Meritcoin yield multipliers (bottom-up incentive shaped by top-down trajectory). The convergence point is

where the bottom-up solution simultaneously satisfies the top-down constraint. When convergence is achieved across all twelve closure systems, the architecture is complete.

8. The Palindromic Curriculum Bridge

MIT / SPRU / BAIDU : BAIDU / SPRU / MIT

8.1 The Education Layer Must Match the Infrastructure

An architecture that survives at interstellar scale but cannot be taught dies with its creator. The TETRA certification system delivers a 4×4×4 cube of 64 modules through a palindromic institutional bridge subject to VLSA verification. A student entering from the West (MIT as engineering anchor) and one entering from the East (BAIDU as AI/population-scale anchor) traverse structurally identical content, converge at the SPRU policy bridge (carrying the ERES method as denominator in C=R×P/M), and emerge with the same SSSC credential. Direction-invariant because the governing equation is direction-invariant.

8.2 The TETRA Cube

Level	Credential	Yield	Hours	Competencies
101 Foundations	SSSC	1.5x	480	Core principles; BERA sensor literacy; PlayNAC governance basics; EarnedPath mechanics; GCF comprehension
201 Measurement	Specialist	2.0x	480	BERA calibration; CyberRAVE protocols; Meritcoin yield optimization; GraceChain audit; NBERS interpretation
301 Integration	Practitioner	3.0x	480	Cross-pillar integration; RT Media delivery; PlayNAC simulation design; MIEVM methodology; COE operational planning; GERP coordination
401 Advanced	CERT:TETRA-FULL	5.0x	480	COE establishment; curriculum replication authority; VLSA verification; interstellar closure audit; authority to train next generation

Four SCALULAR pillars — Health (SSHP), Law (SSLA), Protection (SSPS), Skills/Trade (SSST) — cross four levels across four delivery contexts (MIT, BAIDU, SPRU, COE Network) = 64 modules, 1,920 hours. Each module measurable through BERA, credentialed through EarnedPath, recorded on GraceChain, compensated through Meritcoin, and accounted through NBERS.

8.3 Self-Healing Against Institutional Capture

No institution owns the curriculum — commons property under CCAL v2.1. The palindrome self-heals: if any anchor withdraws, CERT:TETRA-FULL graduates continue delivery independently.

> *On a generation ship with no MIT, no BAIDU, no institutions at all — only the structural grammar, the TETRA cube, and qualified graduates remain. The*

> *curriculum survives the institutions that launched it. Teaching is the highest-yield mining operation — it multiplies resonance without diminishing anyone else's.*

9. The Mathematical Foundation

Formula 1: The Governing Equation

$$C = R \times P / M$$

Cybernetics = Resource × Purpose ÷ Method. Scale-invariant, time-invariant, direction-invariant. Resource and Purpose maximize; Method minimizes.

Formula 2: The Physical Equation

$$M \times E + C = R$$

Matter × Energy + Constant = Reason. The physical substrate: material and energetic inputs governed by natural law producing rational outcomes.

Formula 3: The Resonance Equation

$$REAL = (E \cdot M \cdot R) / (T \cdot S)$$

Energy · Matter · Resonance over Time · Space. No repeated letters. Measures intensive properties (ratios) rather than extensive properties (absolutes) — which is why it scales from THOW to generation ship.

Formula 4: The EarnedPath Equation

$$EP = CPM \times WBS + PERT$$

Critical Path Method × Work Breakdown Structure + Program Evaluation and Review Technique. The credentialing equation that makes human capability measurable, verifiable, and reproducible across generations.

Formula 5: The Graceful Contribution Formula

$$GCF = \Sigma[Contribution_i \times Impact_i \times Sustainability_i \times Verification_i]$$

The economic engine equation. Translates human action into Meritcoin value through BERA-measured, VERTECA-verified, GraceChain-recorded merit quantification.

Formula 6: The Civilizational Accounting Equation

$$NBERS = UBIMIA \times \Sigma(GCF_i \times PERC_i) + [BERC \cdot JERC]$$

GDP replacement. Universal baseline times merit-weighted contribution plus ecological-ethical correction. Makes civilizational health empirically measurable.

10. Implications for Space Infrastructure Research

Contemporary space infrastructure research — lunar operations, habitat design, advanced sensing, space economy development — is solving closure problems. How does a lunar habitat close its water loop? How does a Mars colony close its materials loop? How does a station close its governance loop when communication delay makes Earth-based authority impractical? These are the same twelve closure problems PlayNAC solves at every scale.

Sensor miniaturization for space sensing programs is a parametric instance of the BERA measurement challenge at S4–S5. 3D printing with simulated regolith is a parametric instance of GSSG self-healing at S3. Autonomous decision-making for long-duration missions is a parametric instance of PlayNAC governance at S6, where delay is measured in years. Workforce development for the space economy requires exactly what the TETRA palindromic bridge provides: certification systems producing graduates capable of operating closed-loop environments, delivered across institutional and cultural boundaries.

The palindromic bridge (MIT/SPRU/BAIDU : BAIDU/SPRU/MIT) addresses the cross-border collaboration challenge directly. UK-US space industry linkage, Artemis partnerships, and integration of Chinese capabilities all require education architectures functioning across boundaries. The palindrome achieves this by making the curriculum direction-invariant: same structural grammar regardless of entry point.

11. Conclusion: Build the THOWs — The Ship Follows

The bottom-up/top-down convergence architecture presented in this paper demonstrates that the component list for planetary survival is identical at every scale — from homestead to generation ship — and that the engineering between scales is parametric, not architectural.

PlayNAC provides the master game-theoretic framework. EarnedPath develops qualified humans. GERP coordinates planetary resources. GAIA SOMT weaves the sociocratic nervous system. VERTECA enforces verification and accountability. Meritcoin and GraceChain run the economic engine through the Graceful Contribution Formula. NBERS replaces GDP with empirically grounded civilizational accounting. BERA provides the biometric measurement layer that keeps everything testable. The four BEE technologies (THOW, HFVN, FDRV, GSSG) provide the physical infrastructure. The twelve closure systems close their loops at every scale.

The VLSA Principle verifies: test at S0, validate at S6. The 1000-Year Future Map constrains: every decision tested against the Three Governing Principles. The palindromic curriculum preserves: the education survives the institutions that launched it.

> *The species does not need to build a generation ship to test the architecture. It needs to build THOWs. Millions of them. The ship follows.*

About the Author

Joseph Allen Sprute is the Founder and Director of the ERES Institute for New Age Cybernetics, established February 2012 in Bella Vista, Arkansas. U.S. Army veteran (Oregon Army National Guard, 1983–1989, Infantry 11B, Honorable Discharge). 408 publications on ResearchGate spanning the complete ERES architecture from CyberRAVE (pre-1997) through SaleBuilders (1997–2012) to the current ERES Institute era. Cross-Pacific collaboration with SYU JIA WUN (Tatung University, Taiwan). Formal submissions to The Hague (ERES-HAGUE-2026-001), ISO/ANSI standards bodies, and DBDM 2026 (Sydney).
