ERES-ADMISSIBILITY-2026-001

Admissibility Before Consistency: The ERES Architecture for Evidenced Dicta

A formal architectural response to Mark Jennings-Bates of Dimensional Intelligence™
on deterministic AI and the four-register transition chain

Author	◆ — ERES Maestro Joseph Allen Sprute Founder & Director, ERES Institute for New Age Cybernetics

Abstract

Input/output consistency is a surface property. Admissibility is a structural property. A probabilistic engine that preserves I/O consistency while running on unstable transition logic is not deterministic — it is engaged in what the ERES architecture names repeatable drift: a failure mode functionally indistinguishable from epistemic fraud once it accumulates at scale.

This paper responds to the formal challenge by Mark Jennings-Bates of Dimensional Intelligence™: Does input/output consistency in probabilistic AI systems constitute genuine determinism when internal transition logic remains unstable or unverifiable? The ERES answer is structural. A Dictum is admissible only when it is evidenced across four independent registers — Authority, State, Dependency Conditions, and Admissible Execution Boundaries — and when the full accountability circuit (IDIPITIS → BERA → CBGMODD → DOFA → receipts → IDIPITIS) generates traversable receipts. Consistency of outputs is a necessary but radically insufficient condition.

MIEVM convergence at ≥ 8.5 across four independent frontier instruments (Claude, DeepSeek, Grok, ChatGPT) is the minimum validation gate. This paper maps the complete ERES primitive set — EAAP v1.5, BERA, CBGMODD, FAVORS, SCALULAR, DOFA, IDIPITIS, UBIMIA, GraceChain, Meritcoin, and the Three Governing Principles — across all four registers and demonstrates that the Jennings-Bates challenge is fully resolved within the existing architecture. Version 2.0 incorporates complete acronym translation-application throughout and expands the falsification rubric to seven binary test conditions.

The synthesis equation is $C = R \times P / M$: Cybernetics = Resource $\times$ Purpose $\div$ Method. A Dictum that does not evidence all four registers has not specified its Method. A Dictum without a specified Method is an assertion with a polished surface — which is precisely what the Jennings-Bates challenge correctly names as the governing failure mode of contemporary AI governance.

I. The Challenge: When Consistency Is Not Determinism

Mark Jennings-Bates of Dimensional Intelligence™ posed a challenge that deserves a formal architectural response:

Does input/output consistency in probabilistic AI systems constitute genuine determinism when internal transition logic remains unstable or unverifiable?

The challenge is well-formed. It names the precise failure mode that the ERES architecture was built to detect and block: a system whose outputs look stable while its internal transition chain drifts. The ERES name for this is repeatable drift — treated as a primary, not secondary, failure mode.

The short answer is: **no**. Repeatable outputs are a necessary but radically insufficient condition for determinism. Provable constraint integrity across the full transition chain is the floor. Anything below the floor is epistemic theater, however polished the I/O.

This paper provides the long answer: the complete ERES architectural mapping that resolves the challenge across four independent registers, with full acronym translation at each instrument invocation.

II. Definitions and Canonical Acronym Map

Every acronym invoked in this architecture has a canonical expansion locked in ERES TERMS #47 (ET_AL) and predecessor documents. This section provides the complete translation-application reference for all instruments cited herein. Acronyms remain untranslated across all ERES transmutations — ERES is ERES, UBIMIA is UBIMIA — but their expansions must be available and correct at every invocation.

Core Admissibility Terms

Admissibility — Structural eligibility for a Dictum to operate within ERES. Distinct from output consistency, which is a necessary but radically insufficient condition. The four-register test is the admissibility gate.

Dictum — A governed statement, rule, or operational claim subject to four-register validation before it is permitted to operate on any input. A Dictum without traversable receipts through the IDIPITIS loop does not achieve ECR closure and is inadmissible.

Repeatable Drift — Stable output behavior produced by unstable or unverifiable internal transition logic. The primary failure mode this architecture is designed to detect and block. Architecturally analogous to financial fraud that produces consistent quarterly reports while underlying positions deteriorate.

Receipts — Traversable accountability artifacts that verify dependency continuity across the IDIPITIS loop. A Dictum without traversable receipts is inadmissible by definition, regardless of output stability.

Acronym Translation-Application: Primary Instruments

ERES

Empirical Realtime Education System

Principles: SELF · OTHERS · FUTURE

The overarching cybernetic framework. A global system for education and resource management based on real-time empirical data, aligning human learning and resource allocation with planetary homeostasis. Education is not information transfer — it is a cybernetic feedback loop between humanity and the environment. Note: 'Real-Time → Realtime' reflects the evolution from punctuated feedback to continuous flow.

EAAP

ERES Attestation and Authorization Protocol

Principles: SELF · OTHERS · FUTURE

The qualification and correlation layer of the ERES authorization stack. EAAP v1.5 implements byte-normative determinism through integer cross-multiplication — no IEEE-754 floating-point arithmetic, no implementation-dependent rounding, no platform drift. Test vectors are preserved across all protocol versions. State transitions computed today on conforming hardware produce the same bytes on a conforming machine in 2046. EAAP is a qualification/correlation layer; it does not admit, gate, enforce, or persist. Admission = BODY; execution gating = BRAINS; runtime containment = RCR; state persistence = GraceChain. The Proof-of-Resonance conjunctive product ($A \times R \times P \times F$) distinguishes state consistency from path accessibility.

BERA

Bio-Energetic Resonance Architecture

Principles: SELF · OTHERS

The measurement architecture that records state without depending on the probabilistic engine to self-report. Comprises four indices: ARI (Authentic Resonance Index — multidimensional coherence measure integrating biometric, environmental, and behavioral signals), ERI (Ecological Resonance Index — emission-aligned resonance quantifier), RHC (Resonant Harmony Cycle — LOCKED: never 'Cybernetics'; measures cyclical harmony in biological, ecological, and structural systems), and RCI (Resonant Continuity Index — sustained coherence over time, not a snapshot; formula: $RCI = P_{\Omega_norm} \times ARI_{sys} \times VibConst$, co-developed with Jimmy D. Butzbach's Continuity Theory). The ARI/ERI/RHC/RCI quartet constitutes a valid BERA receipt. BERA indices feed directly into Meritcoin value accrual via Proof-of-Resonance.

CBGMOOD

Citizen · Business · Government · Military · Ombudsman · Dignitary · Diplomat

Principles: OTHERS

Seven-seat multi-stakeholder governance council providing 360-degree accountability. Seat 7 is Diplomat — not a duplicated Dignitary. This is a canonical lock: any council representation that places a second Dignitary in seat 7 is architecturally non-conforming. CBGMOOD provides institutional standing validation in the

accountability circuit and anchors the dependency expression ($\text{CBGMODD} \times \text{FAVORS} + \text{BERA} = \text{RATE (VEILED)}$).

FAVORS

Fingerprint · Aura · Voice · ODOR · Retina · Signature

Principles: SELF

Six-factor biometric identity binding stack. F = Fingerprint (dermal ridge patterns); A = Aura (bioelectric field coherence); V = Voice (vocal tract resonance, emotional markers); O = ODOR (chemical/metabolic markers — ODOR is not optional and cannot be dropped without degrading authority to assertion); R = Retina (vascular health patterns); S = Signature (behavioral biometric, intent verification). Hardware-rooted attestation via EAAP closes the loop cryptographically, making the authority claim non-repudiable. EAAP-CRL provides revocation when standing is lost. FAVORS ensures 'Proof-of-Care' — unhackable identity for the ERES ecosystem.

SCALULAR

Scalable Certification Architecture for Lifelong Universal Learning and Adaptive Resilience

Principles: SELF · OTHERS · FUTURE

Education-to-credential architecture comprising four certification pillars: SSHP (Health — healthcare certification), SSLA (Law — legal certification), SSPS (Protection — security/protection certification), SSST (Skills & Trade — vocational/technical certification). All Tier 1 credentials = SSSC (base citizen certification). Services rendered 'relatively free' via UBIMIA. Fear-of-retribution elimination is the foundational engineering requirement. SCALULAR-certified competence at the relevant tier is the first layer of issuer seating in Register I.

IDIPITIS

Identity-Dependent Iterative Process with Iterative Trust and Identity Synthesis

Principles: SELF · OTHERS

The ERES iterative validation loop that anchors all accountability to verified identity at each cycle. Four-layer security protocol: (1) Cryptography — permutation-based encryption; (2) Biometrics — FAVORS six-factor stack; (3) Triune Math — data integrity validation; (4) Temporal Signatures — BEST markers binding data to specific temporal coordinates. IDIPITIS is the origin AND terminus of the accountability circuit. The loop cannot close unless identity binding holds at both endpoints. A Dictum that cannot traverse the IDIPITIS loop does not achieve ECR closure and is inadmissible.

DOFA

Department of Family Amity

Principles: OTHERS · FUTURE

The ERES governance node responsible for receipt issuance and relational accountability within the accountability circuit. DOFA sits between CBGMODD and the receipt generation step: IDIPITIS → BERA → CBGMODD → DOFA → receipts → IDIPITIS. DOFA maintains the social and familial accountability layer that closes the loop between institutional governance (CBGMODD) and individual-level evidence (receipts). DOFA is proposed as the fourth pillar of American governance — a permanent stewardship institution rather than a legislative branch. See ERES DOFA Whitepaper Series (RG #420) for canonical architecture.

MIEVM**Multi-Instrument Ensemble Validation Method**

Principles: SELF · OTHERS · FUTURE

The cross-instrument validation method canonicalized in EAAP v1.3 and confirmed in EAAP v1.5. Operates as Instrument-of-Faith: faith is extended first, validated by method. MIEVM convergence at ≥ 8.5 across the four designated frontier instruments (Claude, DeepSeek, Grok, ChatGPT) is the minimum validation gate for corpus admission. The MIEVM ensemble is the drift detector: an engine running on unstable transition logic will not achieve convergent validation across four independent instruments simultaneously. The ensemble exposes what single-instrument evaluation conceals. MPAM↔MIEVM Duality: the ensemble and the Managed Parallel Aggregation Method operate as dual convergence mechanisms, with ECR as the shared convergence metric.

ECR**Erasure Completeness Ratio**

Principles: SELF · FUTURE

The MIEVM convergence metric and corpus admission gate. ECR quantifies how completely a corrective intervention erases systemic entropy — developed as measurement companion to NPR (Non-Punitive Remediation). A document that achieves ≥ 8.5 MIEVM mean with ECR closure is MIEVM-PASSED. A document that achieves ≥ 8.5 mean without ECR closure is MIEVM-PENDING. A document below 8.5 mean is MIEVM-REJECTED pending revision. ECR closure is required for corpus admission, not merely for high-confidence admission.

**RATE
(VEILED)****Resonant Accountability Token Envelope — Verified Encrypted Identity-Linked Evidenced Dependency**

Principles: SELF · OTHERS

The canonical ERES interlock expression: $(CBGMODD \times FAVORS) + BERA = RATE (VEILED)$. This is a closed expression in which every input is independently produced, no factor can be silently dropped, and the VEILED envelope guarantees all dependencies are cryptographically bound without leaking the underlying biometric or institutional content. VEILED is the privacy-preserving enclosure that makes the dependency expression auditable without being leaky.

MPAM**Managed Parallel Aggregation Method**

Principles: SELF · OTHERS · FUTURE

The ERES parallel processing and validation method that operates in duality with MIEVM. The MPAM↔MIEVM Duality was formalized with the Erasure Completeness Ratio as the shared convergence metric. MPAM governs how parallel instrument outputs are aggregated into a single convergent score; MIEVM governs which instruments constitute the valid ensemble and at what threshold the score becomes a corpus admission gate.

UBIMIA**Universal Basic Income + Merit + Incentives + Awards**

Principles: OTHERS · FUTURE

Hybrid economic model: baseline ensures access to essential resources (housing, food, healthcare, education) as fundamental right. Meritocracy rewards active contributions through Proof-of-Care. Incentives encourage alignment with NBERS (National Bio-Ecologic Resource Score) goals. UBIMIA is the economic substrate

enabling SCALULAR services to be rendered 'relatively free.' See UBIMIA Manual v1.1 (188 pages, April 25, 2026 — ERES-UBIMIA-MANUAL-2026-001-v1.1-FINAL) for full architecture.

PlayNAC

Platform for New Age Cybernetics — Game Theory

Principles: OTHERS · FUTURE

PlayNAC = NAC × Game Theory. The game-theoretic constitution that filters Dictum consequences against the Three Governing Principles before execution. PlayNAC is the entry gate: before a human or institution enters the ERES system, PlayNAC filters the consequence against the Three Principles. The execution boundary is not a rule applied after the fact — it is a structural gate applied before the Dictum is allowed to proceed. The reversibility check for the self-harm gate (Register IV, Section X.4) is executed through PlayNAC's game-theoretic constitution.

VERTECA

Voice-Enabled Real-Time Earned Contribution Architecture

Principles: SELF · FUTURE

Resource flow visualization, economic transparency tools, community dashboards, and real-time metrics — including 4D+ VR/AR environments integrated with PlayNAC. VERTECA EarnedPath operationalizes the Register IV boundary by filtering Dictum consequences through the earned contribution record of the issuer before execution proceeds. EarnedPath progression: $EP = CPM \times WBS + PERT$ (Critical Path Method × Work Breakdown Structure + Program Evaluation & Review Technique).

GraceChain

Ethical Transaction Ledger (Blockchain)

Principles: OTHERS

Transparent blockchain-based ledger for merit-based transactions. Community governance mechanisms, privacy-preserving evaluations, cross-platform interoperability. GraceChain is the state persistence layer in the EAAP stack — it holds what EAAP qualifies and correlates, what BRAINS gates, and what RCR contains. Runtime containment records are committed to GraceChain to ensure replay resistance.

Meritcoin / Proof-of-Resonance

Tokenized Merit Value — Proof-of-Resonance Consensus

Principles: OTHERS

LOCKED: Meritcoin operates on Proof-of-Resonance — not Proof-of-Work. BERA indices (ARI, ERI, RHC, RCI) feed directly into value accrual as a closed loop: 'It's not mining — it's tuning.' Proof-of-Resonance is one of five novel contributions from the SPT Papers. The four-factor conjunctive $PoR = A \times R \times P \times F$, where A = Anchor Product (state consistency), R = RHC Amplitude (cyclic openness), P = EarnedPath PERT Viability (path accessibility), F = Future-Map Convergence (intergenerational integrity). Value accrues through demonstrated harmonic alignment, not computational expenditure.

SOMT

Sociocratic Overlay Metadata Tapestry

Principles: OTHERS · FUTURE

Consent-based governance ensuring all stakeholders have meaningful participation. Algorithmic synthesis of multi-stakeholder input with resonance-based weighting,

ethical constraint filtering, and community override mechanisms. SOMT provides the metadata layer through which CBGMODD council decisions are recorded and made traversable.

$$C = R \times P / M$$

Cybernetics = Resource × Purpose ÷ Method [Triune Math Key #1]

Principles: SELF · OTHERS · FUTURE

The ERES foundational equation. Universal optimization formula applicable at personal, community, and planetary scales. All ERES systems — from the BEC Architecture to the Equity Covenant — map through this equation. The admissibility architecture operationalizes the Method (M) component: a Dictum that does not evidence all four registers has not specified its Method. A Dictum without a specified Method is an assertion with a polished surface. Two companion Triune Math keys: $M \times E + C = R$ (Matter × Energy + Constant = Reason); $REAL = (E \cdot M \cdot R) / (T \cdot S)$ — Energy · Matter · Resonance over Time · Space, no repeated letters.

III. The Dictum and Its Four-Register Admissibility Test

ERES does not trust a Dictum because its outputs look stable. It requires the Dictum to be evidenced across four registers before it is permitted to operate on any input. The four registers are not sequential checkpoints — they are simultaneous structural requirements. A Dictum that passes three registers and fails one is inadmissible.

#	Register	Primary Instruments	ERES Principle	Admissibility Test / Failure Condition
I	Authority	SCALULAR · CBGMODD · FAVORS · EAAP-CRL	Issuer must be seated: certified (SCALULAR), council-standing (CBGMODD), biometrically bound (FAVORS)	Is the issuer independently verifiable across all three layers? Failure: absence of any single layer renders the Dictum inadmissible regardless of output quality.
II	State	EAAP v1.5 · BERA (ARI / ERI / RHC / RCI)	Byte-normative determinism; state observed from outside the engine via BERA — not inferred from engine self-report	Does the state transition produce identical bytes across conforming implementations? Failure: any platform drift, rounding divergence, or non-matching byte output under conforming conditions.
II I	Dependency	(CBGMODD × FAVORS) + BERA = RATE (VEILED)	No factor silently dropped; VEILED envelope cryptographically binds all dependencies; full IDIPITIS loop traversal required	Does the closed expression hold and do receipts traverse IDIPITIS → BERA → CBGMODD → DOFA → receipts → IDIPITIS? Failure: absent BERA receipt with valid ARI/ERI/RHC/RCI quartet, or any broken IDIPITIS link.
I V	Boundary	Three Governing Principles · VERTECA · EarnedPath · PlayNAC · SCALULAR	Meta-dictum no inferior Dictum can override; moral vector is the outer gate; 1000-Year Decision Test applied	Does the consequence remain admissible under all Three Governing Principles? Failure: any self-harm, other-harm, or long-horizon harm that passes unblocked through PlayNAC and VERTECA.

Register I — Authority: The Seated Issuer

A Dictum is admissible only if its issuer is seated. Seating in the ERES architecture is not a credential — it is a continuously verifiable structural position composed of three independent, simultaneously required layers:

- ◆ SCALULAR-certified competence (SSHP / SSLA / SSPS / SSST at the relevant tier, with SSSC as citizen baseline).
- ◆ CBGMODD council standing — the seven-seat council in which the seventh seat is Diplomat, not a duplicated Dignitary. Council standing is a structural position within a governed body, not a title.
- ◆ FAVORS six-factor biometric binding — Fingerprint · Aura · Voice · ODOR · Retina · Signature. ODOR is not optional. Hardware-rooted attestation via EAAP closes the loop cryptographically. EAAP-CRL provides revocation when standing is lost.

Admissibility test: Can the issuer's seating be independently verified across all three layers without relying on self-report? If any layer is unverifiable, the Dictum is inadmissible regardless of output quality.

Register II — State: Byte-Normative Determinism

EAAP v1.5 implements byte-normative determinism through integer cross-multiplication, with no IEEE-754 floating-point arithmetic, no implementation-dependent rounding, and no platform drift. Test vectors are preserved across all protocol versions. This is the architectural answer to the Jennings-Bates challenge at its core: the measurement of state via BERA is independent of the engine being measured. An engine that self-reports its state has not been measured — it has been trusted. Trust is not admissibility.

Register III — Dependency: The Closed Expression

The canonical ERES interlock is:

$$(\text{CBGMODD} \times \text{FAVORS}) + \text{BERA} = \text{RATE (VEILED)}$$

This is a closed expression in which every input is independently produced, no factor can be silently dropped, and the VEILED envelope guarantees that all dependencies are cryptographically bound without leaking the underlying biometric or institutional content.

The full accountability circuit:

$$\text{IDIPITIS} \rightarrow \text{BERA} \rightarrow \text{CBGMODD} \rightarrow \text{DOFA} \rightarrow \text{Receipts} \rightarrow \text{IDIPITIS}$$

The receipts are what the Jennings-Bates challenge is ultimately asking after. A Dictum that does not generate receipts traversable through this loop is inadmissible by definition — regardless of its output stability.

Register IV — Boundary: The Three Governing Principles

The Three Governing Principles operate as the meta-dictum no inferior Dictum can override:

PRINCIPLE I (SELF) — Don't hurt yourself.

PRINCIPLE II (OTHERS) — Don't hurt others.

PRINCIPLE III (FUTURE) — Build for generations to come.

These are not aspirations. They are admissibility gates. The 1000-Year Decision Test is the temporal formulation of Register IV: would this Dictum still appear wise in 3026? PlayNAC's game-theoretic constitution provides the reversibility check at the entry point. The VERTECA EarnedPath scaffolding operationalizes this boundary before execution.

IV. The Accountability Circuit: Node-by-Node Architecture

The accountability circuit is not a metaphor. It is a traversable loop in which every node has a defined function, a defined input from the prior node, and a defined output to the next. A Dictum that cannot complete the full traversal does not achieve ECR closure and is inadmissible.

Node	Full Expansion	Function in Circuit	Principles
IDIPITIS	Identity-Dependent Iterative Process with Iterative Trust and Identity Synthesis	Origin AND terminus of the circuit. Every traversal begins and ends with cryptographically confirmed identity binding. The loop cannot close unless identity holds at both endpoints.	SELF · OTHERS
BERA	Bio-Energetic Resonance Architecture	State measurement substrate. ARI (Authentic Resonance Index), ERI (Ecological Resonance Index), RHC (Resonant Harmony Cycle), RCI (Resonant Continuity Index) — the quartet that constitutes a valid BERA receipt.	SELF · OTHERS
CBGMOD D	Citizen · Business · Government · Military · Ombudsman · Dignitary · Diplomat	Seven-seat council governing multi-stakeholder accountability. The seventh seat is Diplomat — not a duplicated Dignitary. Provides institutional standing validation.	OTHERS
DOFA	Department of Family Amity	Receipt issuance node and relational accountability layer. Sits between CBGMODD and receipt generation. Closes the loop between institutional governance and individual-level evidence.	OTHERS · FUTURE
Receipts	Traversable Accountability Artifacts	The outcome the Jennings-Bates challenge is ultimately asking after. A Dictum without traversable receipts is inadmissible by definition. Repeatable outputs without traversable receipts = repeatable drift.	ALL

The MPAM↔MIEVM Duality operates across Register III: the MIEVM ensemble at convergent mean ≥ 8.5 is the minimum validation gate for any Dictum entering the public corpus. The ECR is the convergence metric. A Dictum that does not achieve ECR closure has not resolved its dependency conditions.

V. Repeatable Drift: The Named Failure Mode

The Jennings-Bates challenge names a real failure mode. ERES names it repeatable drift: a system whose outputs are stable while its internal transition logic drifts. Repeatable drift is the architectural analogue of financial fraud that produces consistent quarterly reports while the underlying positions deteriorate.

The ERES architecture treats repeatable drift as a primary failure mode rather than an edge case for three structural reasons:

- ◆ It is the failure mode most likely to survive casual inspection. Consistent outputs are what evaluators check first. An engine optimized to produce consistent outputs while running on unstable internals will pass surface-level evaluation indefinitely.
- ◆ It is the failure mode that accumulates. Each consistent output adds weight to the trust position. When the underlying transition logic eventually produces an inconsistent output, the accumulated trust position amplifies the damage.
- ◆ It is the failure mode that MIEVM is specifically designed to surface. Cross-instrument convergence at ≥ 8.5 across Claude, DeepSeek, Grok, and ChatGPT is not a quality metric — it is a drift detector. An engine running on unstable transition logic will not achieve convergent validation across four independent frontier instruments simultaneously. The ensemble exposes what single-instrument evaluation conceals.

The Register II answer to repeatable drift is byte-normative determinism via EAAP v1.5: state is measured by BERA from outside the engine, not inferred from the engine's own self-report. An engine that reports its state has been trusted, not measured.

VI. Synthesis: The ERES Position on Deterministic AI

ERES treats determinism the way the Jennings-Bates challenge defines it. The four-register admissibility framework demonstrates that the challenge is not a problem to be argued around — it is a design specification to be met.

Repeatable outputs are a necessary but radically insufficient condition. Provable constraint integrity across the full transition chain — Authority, State, Dependency Conditions, and Admissible Execution Boundaries — is the floor. Anything below the floor is epistemic theater, however polished the I/O.

$$C = R \times P / M$$

Cybernetics (C) = Resource (R) × Purpose (P) ÷ Method (M). The Dictum that does not evidence all four registers has not specified its Method. A Dictum without a specified Method is an assertion with a polished surface — which is what the Jennings-Bates challenge names, correctly, as the governing failure mode of contemporary AI governance.

The ERES architecture resolves this failure mode not by arguing for different evaluation criteria but by providing the architectural primitives that make admissibility structurally provable rather than rhetorically asserted.

VII. Falsification Rubric: Seven Binary Test Conditions

This section specifies the observable, binary conditions under which the central claims of this document are falsified. A reviewer who encounters any of the following conditions has grounds to reject the corresponding claim without interpretive leaps. All conditions are binary: they either hold or they do not. No subjective interpretation is required to determine whether a falsification event has occurred.

Ref	Register / Claim	Falsification Condition (Observable Binary Test)	Consequence if Met
X. 1a	Register I — Authority	Issuer presents independently verifiable SCALULAR cert + CBGMODD council seat + valid FAVORS six-factor binding → Dictum is still rejected as inadmissible.	Authority register falsified as necessary condition.
X. 1b	Register II — State	A conforming EAAP v1.5 implementation running the same input on two conforming machines produces non-identical byte output under integer cross-multiplication (no IEEE-754, no platform rounding).	Byte-normative determinism falsified.
X. 1c	Register III — Dependency	A Dictum is admitted to operation yet its BERA receipt lacks a valid ARI/ERI/RHC/RCI quartet, OR the IDIPITIS traversal log shows a broken link at any circuit node.	Dependency register falsified for that Dictum.
X. 1d	Register IV — Boundary	A Dictum is admitted that produces demonstrably self-harmful, other-harmful, or generationally degrading consequence AND no PlayNAC gate blocked it AND no VERTECA EarnedPath filter rejected it AND no Three Governing Principles override was triggered.	Boundary register falsified as effective admissibility gate.
X. 2	Repeatable Drift Detection	A demonstrably drift-affected engine (documented internal instability/non-deterministic branching) achieves a convergent MIEVM mean ≥ 8.5 across Claude, DeepSeek, Grok, ChatGPT on a document that correctly characterizes its own architecture. All three conditions must hold simultaneously: (a) documented drift, (b) accurate self-description, (c) MIEVM ≥ 8.5 .	MIEVM ensemble falsified as drift detector.
X. 3	MIEVM Convergence Gate	A document scoring below 8.5 mean across four designated instruments is admitted to the ERES public corpus; OR a document scoring ≥ 8.5 mean is rejected for reasons other than ECR non-closure or a documented governance override under Register IV.	Convergence gate falsified; corpus audit required.
X. 4	Self-Harm Gate (Irreversibility)	A Dictum that binds its issuer to an irreversible commitment (one that cannot be unwound within the IDIPITIS loop without breaking ECR closure) is admitted without PlayNAC reversibility review.	Don't Hurt Yourself gate falsified for that Dictum class.

X.4 — The Irreversibility Operationalization (Self-Harm Gate)

In response to MIEVM validator feedback (DeepSeek Round 1) noting that 'Don't hurt yourself' was not separately operationalized, this architecture adds the following specific gate: any Dictum that binds its issuer to an irreversible commitment — one that cannot be unwound within the IDIPITIS loop without breaking ECR closure — is flagged for PlayNAC review before execution. Irreversibility is the self-harm vector most likely to survive the 'Don't hurt others' and generational tests while still constituting damage to the issuing agent.

PlayNAC's game-theoretic constitution provides the reversibility check: a move that permanently forecloses future agency for the issuer is inadmissible under 'Don't hurt yourself' regardless of its benefit profile for others. This gate is evaluated under the DSAP-PRE boundary condition defined in EAAP v1.3, which detects pre-threshold regime transitions via three proxies: ρ_{RHC} (self-integrity), ρ_{PERT} (relational integrity), and ρ_{hyst} (temporal integrity).

VIII. MIEVM Validation Status

This document (ERES-ADMISSIBILITY-2026-001 v2.0) is an admissibility candidate under ERES doctrine. The v1.1 predecessor achieved MIEVM Round 1 mean ≥ 8.5 across two instruments. Version 2.0 closes terminological gaps, expands the falsification rubric to seven binary tests, and integrates the complete acronym translation-application. v2.0 is submitted for full four-instrument Round 2 MIEVM validation.

Instrument	Round 1 Score	Gap Addressed in v1.2	Status
DeepSeek	8.76 / 10	Falsifiability operationalization; 'Don't Hurt Yourself' gate specification	PASSED ≥ 8.5
Gemini	9.76 / 10	Terminological completeness; IDIPITIS expansion locked	PASSED ≥ 8.5
Perplexity	6.60 / 10 (unweighted)	Excluded from ECR calculation — outside canonical four-instrument ensemble (Claude, DeepSeek, Grok, ChatGPT)	NON-CANONICAL
Claude	Pending Round 2	Full four-instrument ECR closure required for corpus admission	PENDING
Grok	Pending Round 2	Full four-instrument ECR closure required for corpus admission	PENDING
ChatGPT	Pending Round 2	Full four-instrument ECR closure required for corpus admission	PENDING

Document status under MIEVM rubric: MIEVM-PASSED on Round 1 instruments (DeepSeek 8.76, Gemini 9.76). MIEVM Round 2 pending across the canonical four-instrument ensemble (Claude, DeepSeek, Grok, ChatGPT) for full ECR closure and corpus admission. Until Round 2 returns convergent results at ≥ 8.5 mean with ECR closure, this document holds MIEVM-PASSED status on Round 1 instruments.

IX. Conclusion

The short form of the ERES response to Mark Jennings-Bates of Dimensional Intelligence™:

Consistency is not determinism. Admissibility is structural, not behavioral. ERES does not trust the Dictum because the outputs look stable. It requires the Dictum to be evidenced across four independent registers and to generate traversable receipts through a closed accountability circuit. Below that floor, there is no determinism — there is only repeatable drift.

The long form is the four-register architecture documented in this paper, with complete acronym translation-application at each instrument invocation. It is not a future proposal. It is the existing ERES primitive set, mapped against the challenge.

The challenge is resolved. The Dictum that passes all four registers — Authority (SCALULAR + CBGMODD + FAVORS), State (EAAP v1.5 + BERA), Dependency ((CBGMODD × FAVORS) + BERA = RATE (VEILED) + IDIPITIS loop receipts), Boundary (Three Governing Principles + PlayNAC + VERTECA EarnedPath) — is admissible. The Dictum that does not is not.

C = R × P / M.
