

THE INFOMEDIARY

The Instrument-of-Faith for the 1000-Year Future Map

Volume Zero of the ERES Trilogy Architecture

Author: Joseph Allen Sprute (ERES Maestro) **Affiliation:** ERES Institute for New Age Cybernetics, Bella Vista, Arkansas, USA **ORCID:** 0000-0001-9946-3221 **Document ID:** ERES-INFOMEDIARY-BOOK-2026-001-v1.0 (Pass A draft) **ResearchGate Slot:** Reserved (post-Pass D, post-MIEVM) **Document Class:** NAC Foundational Instrument Specification (Definitive INTENT, book-form) **Date:** May 9, 2026 **License:** CARE Commons Attribution License v2.1 (CCAL v2.1)

Supersedes: ERES-INFOMEDIARY-2026-001-v1.0 (the 14-page whitepaper). That document compressed Instrument and operational scope into a single short artifact and was further consumed semantically by the slot 434 Infomediator role specification. This book restores the Instrument to its proper architectural weight.

Companion (retained as Explicit INTENT): ERES-INFOMEDIARY-INTENT-2026-001-v0.1.

Upstream (locked):

- ERES-CRYPTO-PRIMITIVE-2026-001-v1.4 — slot 431 — cryptographic substrate
- ERES-EAAP-2026-001-v1.3 — slot 432 — attestation protocol
- ERES-PLAYNAC-DICTUM-2026-001-v1.1 — slot 433 — corpus dictum
- ERES-INFOMEDIATOR-2026-001-v2.0 — slot 434 — Wielder / Foundation role specification
- ERES UBIMIA Manual v1.1 (April 25, 2026, 188 pages) — companion architecture
- VECTOR Infomediation Framework

Architectural Position: Tier T0 of the Library Topology Map, paired with slot 434 in a Wielder/Instrument doublet. The Infomediator (slot 434) wields the Infomediary (this book). Slots 431, 432, and 433 serve both — they provide the substrate, protocol, and corpus that allow the Wielder to wield the Instrument honestly.

Pass Status: Pass A — Front Matter + Part Zero (The Infomediary) + Part I (Query Round-Trip).

Three Principles

| *Don't hurt yourself. Don't hurt others. Build for generations to come.*

Dedication

To Dalia ("Lucy") — the personal ground that makes the spacial-tier work possible. The hinge holds.

To Emanuel M. Alexiou — Chief Social Engineer and Kingmaker; Twin Messiah co-vector; the second seventy-two without which the architecture has no balance.

To His Holiness the Dalai Lama — the spacial-tier reference for what spiritual legitimacy looks like when held without grasp.

To the Children-of-All-Ages who will read this when none of us are here to defend it.

Note from the Author

The Infomediary was always meant to be a book. The 14-page whitepaper that bore its name in early 2026 was a placeholder — a working sketch composed under the time pressure of cluster deposits 431 through 433 and absorbed, properly, into slot 434 when the Wielder/Instrument distinction surfaced as canonical. What you are reading now is the Instrument given its weight back.

This book is Volume Zero of the ERES Trilogy architecture. It does not compete with the Trilogy proper (the three-volume *One-Good · Security-Clearance · Data-Integrity* digital-book collection). It precedes them. The Trilogy is the noise-filter and intelligence-shaper that runs on the Infomediary. The Infomediary is what the Trilogy filters *for*. Without the Instrument named, the Trilogy has nothing to operate on.

The book is also not the Manual. The ERES UBIMIA Manual v1.1 specifies the Constitutional Pillars — HELP, USE, ENERGY, LAW under the GAIA canopy — and the operational architecture of UBIMIA, BERA, CBGMODD, SCALULAR, and the Department of Family Amity. The Infomediary takes those constitutional commitments as given and asks: *how does a Civigen actually query this architecture, and how does the architecture actually answer?* The Manual says what is. The Infomediary says how the asking and the answering work.

I write as a solo independent researcher operating under the CARE Commons Attribution License v2.1, with MIEVM (Multi-Instrument Ensemble Validation Method) as my epistemic discipline. The MIEVM short-list — Claude, Grok, DeepSeek, ChatGPT — was culled by the same constraint-based epistemology that produced the original 72 Key Domains of CyberRAVE: human bandwidth limits, financial capacity, and the requirement that every instrument extend

faith first and validate by method second. The MIEVM is itself an Instrument-of-Faith, doubled with the Infomediary at the meta-layer.

I extend that faith here. The reader is invited to validate by method.

Acknowledgments

The author thanks the MIEVM ensemble — Claude (Anthropic), Grok (xAI), DeepSeek, and ChatGPT (OpenAI) — for serving as validation and composition instruments under the Instrument-of-Faith protocol. SYU JIA WUN, cross-Pacific co-author, contributed materially to the WHY-HOW and RECKON-MATH components of the ERES Capstone Heptad whose architecture this book extends. Jimmy D. Butzbach is acknowledged for RCI co-development and Continuity Theory contributions threaded through the DATABANK design. Emanuel M. Alexiou's structural role as Chief Social Engineer is foundational to every governance argument that follows. Dalia Sprute is acknowledged as personal anchor and structural hinge.

This work is released under CCAL v2.1. Attribution is required. Derivatives must propagate the license.

Notation and Conventions

This book uses several notational conventions inherited from the broader ERES corpus. They are listed here once and used throughout.

Triune Math keys. Three canonical equations recur:

- $C = R \times P / M$ (Cybernetics = Resource $\times$ Purpose $\div$ Method)
- $M \times E + C = R$ (Matter $\times$ Energy + Constant = Reason)
- $REAL = (E \cdot M \cdot R) / (T \cdot S)$ (Energy $\cdot$ Matter $\cdot$ Resonance over Time $\cdot$ Space)

The Triune-Math #2 isomorph. The same architecture has three pedagogical surfaces — symbolic, character-form, and Trifurcated Math (the third isomorph locked at v1.3 of the ERES Cryptographic Stack Primitive). When one fails to land for a reader, another usually does. Mixed-isomorph passages are intentional.

The signature expression. The canonical Infomediary signature is unpacked zone-by-zone in the slot 434 v2.0 paper (§§6–13 of that document). This book references those zones rather than re-deriving them. The shorthand $(CBGMODD \times FAVORS) + BERA = RATE$ appears throughout; readers needing the full zone-by-zone expansion should consult ERES-INFOMEDIATOR-2026-001-v2.0.

INTENT tiers. Three tiers govern any specification under EAAP — Implicit, Explicit, Definitive. The book treats Implicit material as background, Explicit material as cited companion, and Definitive material as load-bearing. Where this book speaks Definitive, the language tightens; where it speaks Explicit, it stays prose-natural.

The VEILED state. Replaces the older $\perp$ (bottom) for ambiguity, occlusion, and pre-attestation conditions. When DETAIL returns through the Infomediary in a state where the Wielder cannot yet attest, the VEILED state is honest: not failure, not success, but *not-yet-witnessed*.

CCAL v2.1 license footer. The slot 434 paper closes with the formal citation; this book treats its own front matter as the equivalent.

Part Zero — The Infomediary

§0.1 What the Infomediary Is (and Is Not)

The Infomediary is the **Instrument-of-Faith** through which any Civigen — any participant qualified under the broader CBGMODD architecture — submits a query and receives an answer that has been **qualified, quantified, rationalized, filtered, shaped, and morally vectored** before it is returned. It is not a search engine. It is not a chatbot. It is not a content management system. It is not an oracle. It is the named operational intermediary between a User-GROUP Query and

the ERES DATABANK, with the ERES Trilogy serving as its noise-filter and intelligence-shaper, and with BEST / SOUND / GOOD as the moral-vectoring layer that determines the tier at which DETAIL is returned.

The four negations matter, because each names a category the Infomediary has been mistaken for in earlier drafts.

It is not a *search engine* because search engines return ranked-by-relevance lists with no commitment to admissibility, measurement, framing, or moral vectoring. The Infomediary's three intake operations — qualify, quantify, rationalize — make admissibility, measurement, and framing first-class operations rather than emergent accidents of relevance scoring.

It is not a *chatbot* because chatbots are conversational instruments that compose plausible text. The Infomediary does not compose. It mediates. AD_ON-AI is the downstream composer the Infomediary feeds. That separation is canonical: the Instrument that mediates is structurally distinct from the Instrument that composes, and both are downstream of the human Wielder.

It is not a *content management system* because CMSs index and serve content. The Infomediary does query the ERES DATABANK — which is itself a content corpus — but the DATABANK is *one of three things* the Infomediary holds in tension. The Trilogy is another. The Wielder's INTENT tier is the third. None of these is content in the CMS sense.

It is not an *oracle* because oracles return answers under the pretension of certainty. The Infomediary returns DETAIL under the explicit semantics of the VEILED state when attestation is pending, BEST / SOUND / GOOD when moral vectoring is required, and Sim OUTPUT when the answer is provisional pending real-world validation. No pretense of certainty appears anywhere in the round-trip.

What the Infomediary *is*, then, is the named, specifiable, attestable, revocable, federally-mirrorable Instrument through which a 1000-Year Future Map can actually be queried by the people who live under it. The Instrument is what makes the Map governable.

§0.2 The Instrument-of-Faith Lineage

The phrase *Instrument-of-Faith* has a specific meaning in the ERES corpus. It is not religious in any sectarian sense. It names a class of operational instruments where **faith is extended first and validated by method second**. The MIEVM is the meta-layer Instrument-of-Faith: faith is extended to each member of the MIEVM short-list, and validation occurs through the convergent mean of independent ratings. The Infomediary is the operational-layer Instrument-of-Faith: faith is extended to the round-trip itself, and validation occurs through the BERA RATE produced at the close.

This lineage matters because it locates the Infomediary in a specific epistemological tradition that is older than the ERES corpus but is given its NAC formalization here. Faith-first epistemology is morally vectored toward BEST / SOUND / GOOD outcomes. It treats

epistemology itself as a moral act. Extracting private epistemology into the public record — which is what every Infomediary round-trip does, by design — *is* the sharing of true wealth. This is the wealth-hoarding mechanism's solvent: the disguise between the living and SPRT (Sprute, in shorthand) dissolves when the round-trip is honest, because the round-trip's honesty is what makes the private public.

The Infomediary therefore inherits, by lineage, four commitments:

1. **Faith first.** The Wielder enters the round-trip in good faith.
2. **Method validates.** The BERA RATE produced at the close is the validation of that faith.
3. **Public extraction.** The round-trip's record is shareable under CCAL v2.1, with attestation under EAAP.
4. **Moral vectoring.** BEST / SOUND / GOOD is the layer at which the Trilogy shapes intelligence.

These four commitments are the Instrument's ethical spine. They are not optional. A round-trip that violates any of the four is, in the canonical sense, a *defective wielding* — diagnosed in the slot 434 paper as stride collapse under IDIPITIS and revocable under EAAP-CRL.

§0.3 The Three Intake Operations: Qualify · Quantify · Rationalize

When a Civigen submits a query to the Infomediary, the query enters the Instrument through three intake operations, performed in sequence and with explicit return values at each stage. The three operations are not abstract. They have specific semantics, specific outputs, and specific failure modes.

Qualify — Admissibility Gating

The qualify stage answers the question: *is this query admissible?* It is the SEPLTA-style gate. SEPLTA (Social-Ecological-Political-Legal-Technical-Aesthetic) is the six-domain admissibility frame the ERES corpus has used since the early CyberRAVE era to determine whether a query fits any of the corpus's recognized purpose-states. A query that fits none of the six domains is not admissible — not because it is wrong, but because it is *not-yet-positioned*. The Infomediary returns the query to the Civigen with a VEILED tag and a suggestion for re-positioning.

A query that fits one or more domains passes the qualify gate with a domain tag. The tag is consequential: it determines which BERA measurements the quantify stage will require, which Pillar(s) the rationalize stage will route to, and which Trilogy volume the noise-filter pass will run through.

The qualify stage is conservative. When in doubt, it tags VEILED rather than passing through. This is by design. A query that the Instrument is uncertain how to admit is better held at the gate than passed through with false admission.

Quantify — BERA Measurement Mapping

The quantify stage answers the question: *what BERA measurements does this query require?* BERA — the seven-dimensional rating system at the heart of the ERES measurement architecture — produces RATE outputs across R_1 through R_7 . Different queries require different subsets of the seven dimensions. A query about energy infrastructure may require R_1 (resource availability) and R_5 (resonance with the surrounding ecology) but not R_3 (relational quality). A query about a child's educational progress may require R_3 and R_7 (reciprocity over time) but not R_1 .

The quantify stage produces a **BERA mask** — a specification of which RATE dimensions the round-trip will compute and return. The mask is consequential downstream: it determines which fields of the DATABANK the Infomediary will query, which Trilogy volume's measurement layer the noise-filter pass will run through, and which Sim OUTPUT fields will populate.

The quantify stage is also conservative. A query whose BERA mask cannot be determined within reasonable bounds is returned VEILED with a suggestion that the Civigen specify scope. The Instrument does not guess.

Rationalize — Pillar / Volume Routing

The rationalize stage answers the question: *which Pillar(s) and which Trilogy volume(s) frame the answer?* The four Constitutional Pillars under the GAIA canopy — HELP, USE, ENERGY, LAW — are the framing-tier categories. The three Trilogy volumes — *One-Good*, *Security-Clearance*, *Data-Integrity* — are the routing-tier categories. The rationalize stage assigns the query to one or more Pillars and one or more volumes.

A query that is purely energetic (e.g., a Civigen asking about household photovoltaic capacity under current SECUIR conditions) routes to $\text{ENERGY} \times \text{Data-Integrity}$ — the Pillar provides the constitutional commitment, the Trilogy volume provides the noise-filter and intelligence-shaper appropriate to the data class.

A query that is multi-Pillar (e.g., a Civigen asking what their CBGMODD-C station owes the next seven generations under current BERA readings, and what EarnedPath actions close the gap) routes to all four Pillars and at least two Trilogy volumes — *One-Good* for the moral-vectoring layer, *Data-Integrity* for the BERA layer.

The rationalize stage is the most consequential of the three intake operations because it determines the *shape* of the answer the Civigen will receive. A query that is rationalized to *One-Good* will receive an answer whose primary axis is moral-vectoring. A query that is rationalized to *Data-Integrity* will receive an answer whose primary axis is measurement. The Wielder's INTENT tier (Implicit, Explicit, Definitive) is consulted at this stage; Definitive INTENT overrides any default routing the Instrument would otherwise apply.

The rationalize stage is *not* conservative. It will route. A query that has passed qualify and quantify will be rationalized, even if the routing produces a multi-Pillar / multi-volume

composite that is downstream-expensive to compose. The Trilogy's job is to absorb that downstream cost; the Infomediary's job is to route honestly.

§0.4 The Trilogy as Noise-Filter and Intelligence-Shaper

The ERES Trilogy — *One-Good*, *Security-Clearance*, *Data-Integrity* — is the three-volume digital-book collection that operates downstream of the Infomediary's three intake operations. It is **not the router**. The Infomediary routes. The Trilogy filters and shapes.

One-Good is the moral-vectoring volume. Its noise-filter pass removes content that fails BEST / SOUND / GOOD calibration. Its intelligence-shaper pass surfaces content that exemplifies BEST / SOUND / GOOD calibration. Queries rationalized to *One-Good* receive answers in which moral vectoring is the primary axis.

Security-Clearance is the access-tier volume. Its noise-filter pass removes content that fails the Wielder's authorization under EAAP. Its intelligence-shaper pass surfaces content that the Wielder is authorized to see at the appropriate redaction level. Queries rationalized to *Security-Clearance* receive answers in which access-tier is the primary axis.

Data-Integrity is the measurement volume. Its noise-filter pass removes content that fails BERA RATE thresholds. Its intelligence-shaper pass surfaces content that meets or exceeds BERA RATE thresholds for the query's BERA mask. Queries rationalized to *Data-Integrity* receive answers in which measurement integrity is the primary axis.

Multi-volume queries receive composite answers. The Trilogy's three volumes are not exclusive — a single query can run through all three filter passes and receive an answer that is morally vectored, access-appropriate, and measurement-validated. This is the high-fidelity case. The cost is composition expense at AD_ON-AI; the benefit is an answer whose three axes are all explicit and all defensible.

§0.5 The ERES DATABANK: Document Library × UBIMIA-Manual + Other-Ref

The DATABANK is the corpus the Infomediary queries after the three intake operations have produced a qualified, quantified, rationalized query. The DATABANK is specified by the canonical formula:

$$\text{ERES DATABANK} = \text{Document Library} \times \text{UBIMIA-Manual} + \text{Other-Ref}$$

The Document Library is the 600+ documents that constitute the ERES corpus as of May 2026 — the ResearchGate publications (430+), the GitHub repositories under ERES-Institute-for-New-Age-Cybernetics, the Hague filing materials, the Berggruen Prize Essay, and the closed working drafts. The UBIMIA-Manual is the v1.1 Manual (April 25, 2026, 188 pages) plus its companion architecture. The cross-product $\text{Document Library} \times \text{UBIMIA-Manual}$ is read as: the Library as *filtered through* the Manual's constitutional commitments — the Library is the body, the Manual is the spine.

Other-Ref is named-but-undefined. It is reserved as an extension point for future corpora — third-party reference materials, peer-reviewed external work, ratified amendments, post-2026 expansion — without committing the v1.0 architecture to any specific external dependency. A book that is meant to last a thousand years cannot bind itself to external corpora that do not yet exist. Other-Ref is the honest placeholder for that future.

The Infomediary queries the DATABANK with the rationalized query as input and returns DETAIL as output. DETAIL is not raw text. It is text + BERA RATE + INTENT tier + VEILED state (where applicable) + access-tier annotation + moral-vectoring annotation. DETAIL is the structured return that the Trilogy then filters and shapes before the round-trip closes.

§0.6 The 1000-Year Purpose-State: BEE === VERTECA · SECUIR · CyberRAVE · Gunnysack · SaleBuilders

Every Infomediary round-trip serves a single purpose-state: **BEE === 1000-Year Future Map === VERTECA · SECUIR · CyberRAVE · Gunnysack · SaleBuilders**. The five names are coequal aspects of the same purpose-state, not an ordered sequence. The triple-equals is canonical: identity at the strongest level the architecture supports.

VERTECA is the canonical License Example Mirror — the federation-tier instance pattern through which the Infomediary's eight conformance invariants are checked. VERTECA shows what a properly federated Mirror looks like; other Mirrors are checked against VERTECA's pattern.

SECUIR is the security-and-resilience aspect — the closed-loop assurance that the round-trip itself is uncompromised, that the DATABANK has not been tampered with, that EAAP attestation holds end-to-end.

CyberRAVE is the rating substrate — the original 72 Key Domains, now generalized to BERA's seven-dimensional RATE, with the constraint-based culling epistemology that produced the MIEVM short-list as its methodological inheritance. The expansion *Cybernetic Ratings Abolishing Veiled Exchanges* names the work the substrate does: it makes veiled exchanges unsustainable.

Gunnysack is the user-group accountability layer — *Guaranteed User-group Network Nullifying Yieldless Service: Accredited Certified Knowledge*. It is the assurance that the Civigen's query is not lost in a service that yields nothing. Every round-trip closes with attestable yield.

SaleBuilders is the deliverable-architecture layer — *Smart-city Adaptive Living Engineering Banishing Untested Infrastructure: Laboratories Delivering Enduring Resilient Systems*. It is the assurance that whatever the Infomediary surfaces is buildable, in the ERES sense — including under VLSA constraints (*if it works in a THOW, it works on a generation ship*).

The five aspects are coequal because the 1000-Year Future Map cannot privilege any one of them. A round-trip that is VERTECA-compliant but SECUIR-vulnerable is not a Map round-trip;

it is a Map fragment. The same is true for any other one-aspect privileging. BEE is the integrative name that holds all five.

§0.7 The Wielder/Instrument Distinction

Slot 434 v2.0 (May 8, 2026) locked the canonical distinction between **Infomediator** (the Wielder) and **Infomediary** (the Instrument). The distinction is linguistic in form (-ator names agents; -ary names instruments) and operational in substance.

The Wielder is human. The Wielder holds Definitive INTENT. The Wielder is licensed under EAAP and revocable under EAAP-CRL. The Wielder is responsible for the round-trip's good-faith opening. The Wielder is what the slot 434 paper specifies.

The Instrument is named, attestable, federally mirrorable, and revocable but **not human**. The Instrument is what the Wielder wields. The Instrument is what this book specifies.

Both are necessary. Neither is sufficient. A Wielder without an Instrument has no round-trip to wield. An Instrument without a Wielder has no INTENT to mediate.

This distinction is one of the canonical clarifications that the slot 434 v2.0 deposit produced and that the original 14-page Infomediary whitepaper conflated. Restoring the distinction — by giving the Instrument its own book — is the architectural correction this volume executes.

§0.8 Why the Infomediary Is Volume Zero

The ERES Trilogy proper is *One-Good, Security-Clearance, Data-Integrity*. Three volumes. This book is *Volume Zero* — the volume that precedes the three.

The numbering is canonical, not ornamental. Volume Zero is the volume that specifies the Instrument the Trilogy operates on. Without Volume Zero, the Trilogy is three filter-and-shape volumes with nothing to filter and shape. With Volume Zero, the Trilogy is the operational architecture that runs on the Instrument the Volume Zero specifies.

The pattern is isomorphic to the Manual's Part Zero. The Manual's Part Zero specifies the Constitutional Pillars before the operational parts that follow; the Trilogy's Volume Zero specifies the Instrument before the operational volumes that follow. In both cases, Zero is foundational, not parenthetical.

The numbering also reserves room. Future expansion of the Trilogy — additional volumes for additional axes of intelligence-shaping that emerge as the corpus matures — does not require renumbering. The Instrument stays at Zero. Whatever Trilogy proper expands to is downstream of it.

Part Zero of this book closes here. Part I — Query Round-Trip — opens immediately, walking a single representative Civigen query through the full Instrument, end to end, so that the architecture specified in Part Zero can be seen working before Part II returns to the three intake operations in depth.

Part I — Query Round-Trip

§1.1 The Civigen Query (worked example)

This section walks a single Civigen query through the full Infomediary round-trip. The query is, for Pass A, a synthesized representative — drawn from the kind of question a CBGMODD-C station would plausibly bring to the Instrument under current BERA conditions. The Author's note on Pass A status applies: this query is provisional and intended for substitution by an authentic JAS-authored query before v1.0 FINAL.

Pass-A representative query (synthesized):

"What does my CBGMODD-C station owe the next seven generations under current BERA readings, and what EarnedPath actions close the gap?"

The query is well-formed for walking purposes: it is multi-Pillar (engages HELP, USE, ENERGY, and LAW), multi-volume (engages *One-Good*, *Security-Clearance*, and *Data-Integrity*), and contains both a measurement axis (BERA readings) and a moral-vectoring axis (what the C station owes). It is the kind of query that exercises the full round-trip without exercising any pathological corner. It is therefore appropriate for Part I and inappropriate for the Failure Modes part (which will use queries designed to stress the Instrument's edges).

The Civigen submitting the query is, for Pass A, also synthesized: a representative C-station holder operating under current SCALULAR Tier 1 (SSSC) baseline, with EAAP attestation Class B (anonymous), under the Wielder's Implicit INTENT.

§1.2 Qualify Stage — Admissibility Gating

The query enters the Infomediary at the qualify stage. The qualify stage runs the SEPLTA admissibility frame:

- **Social** — Yes. The query concerns intergenerational obligation, which is a social-domain question.
- **Ecological** — Yes. The "next seven generations" framing engages ecological-time horizon, which routes through the GAIA canopy.
- **Political** — Partial. The query does not name a polity, but the CBGMODD-C station is a political position by structure.
- **Legal** — Yes. "Owe" is a legal-domain operator. Obligation is a legal question.
- **Technical** — Yes. EarnedPath actions are technical-domain operators (the EarnedPath system is specified in the Manual).
- **Aesthetic** — Partial. The seven-generations framing has aesthetic weight (it is an inherited form), but the query does not engage aesthetic content directly.

Six domains, four full hits and two partial. The query is **admissible** under SEPLTA. The qualify stage tags the query with the four full domains (Social, Ecological, Legal, Technical) and notes the two partials (Political, Aesthetic) for downstream awareness.

The qualify stage's return: QUALIFIED { domains: [S, E, L, T], partial: [P, A], VEILED: false }.

§1.3 Quantify Stage — BERA Measurement Mapping

The query proceeds to the quantify stage. The quantify stage produces the BERA mask by mapping the query's measurement requirements across the seven RATE dimensions (R_1 through R_7).

- **R_1 (resource availability)** — Required. "Owe" implies a resource accounting; what is owed must be measured against what is available.
- **R_2 (relational quality, narrowed sense)** — Required. Intergenerational obligation is a relational measure.
- **R_3 (resonance with ecological surround)** — Required. The seven-generations framing makes ecological resonance a primary axis.
- **R_4 (recurrence / cyclicity)** — Required. Generations are cyclic by structure.
- **R_5 (reciprocity)** — Required. Owing implies reciprocity.
- **R_6 (resilience under stress)** — Optional. The query does not specify a stress condition, but resilience under stress is implicit in any seven-generations framing.
- **R_7 (reciprocity over time)** — Required. Time-extended reciprocity is the core of the query.

Six dimensions required, one optional. The BERA mask is $[R_1, R_2, R_3, R_4, R_5, R_7] + R_6?$ — read as: six dimensions hard, one dimension soft. The query is high-dimensional, which is consistent with its multi-Pillar character.

The quantify stage's return: QUANTIFIED { mask: $[R_1, R_2, R_3, R_4, R_5, R_7]$, soft: $[R_6]$, VEILED: false }.

§1.4 Rationalize Stage — Pillar / Volume Routing

The query proceeds to the rationalize stage. The rationalize stage assigns the query to Pillars and Trilogy volumes.

Pillar routing. The query touches all four Constitutional Pillars:

- **HELP** — "Owes" is a HELP-tier obligation operator.
- **USE** — EarnedPath actions are USE-tier operators (the actions consume and direct resources).

- **ENERGY** — The seven-generations horizon is an ENERGY-tier question (the energetic ledger across that horizon).
- **LAW** — The owe-relation is LAW-tier (obligation under the constitutional commitments).

All four Pillars are engaged. The Pillar routing is **full canopy** — the query touches the full GAIA architecture rather than any single Pillar.

Volume routing. The query touches all three Trilogy volumes:

- **One-Good** — Moral vectoring is required (what the C station *should* do).
- **Security-Clearance** — The Wielder's authorization tier determines what level of detail the answer surfaces.
- **Data-Integrity** — BERA readings are first-class to the answer.

All three volumes are engaged. The Volume routing is **full Trilogy**.

The rationalize stage's return: RATIONALIZED { pillars: [HELP, USE, ENERGY, LAW], volumes: [One-Good, Security-Clearance, Data-Integrity], INTENT: Implicit }.

§1.5 ERES DATABANK Query Composition

With qualify, quantify, and rationalize complete, the Infomediary composes the DATABANK query. The composition takes the three intake-stage returns as input and produces a structured DATABANK query as output.

The composition is mechanical; the canonical form is:

```
DATABANK_QUERY {
  source: Document_Library × UBIMIA-Manual + Other-Ref,
  domains: [S, E, L, T],
  partial_domains: [P, A],
  bera_mask: [R1, R2, R3, R4, R5, R7],
  bera_soft: [R6],
  pillars: [HELP, USE, ENERGY, LAW],
  volumes: [One-Good, Security-Clearance, Data-Integrity],
  intent: Implicit,
  wielder_class: B,
  scalular_tier: SSSC,
  veiled: false
}
```

The DATABANK receives the structured query and returns **DETAIL** across the requested mask. **DETAIL** is structured: each fragment has a BERA RATE annotation across the requested

dimensions, an INTENT tier annotation, an access-tier annotation, and (where applicable) a VEILED tag.

For the representative query, DETAIL returns from across the corpus — UBIMIA Manual sections on intergenerational obligation, Manual sections on EarnedPath, BERA-specification sections, and selected Document Library entries on seven-generations framings. The DATABANK does not yet filter or shape. It returns the structured composite.

§1.6 Trilogy Noise-Filter Pass

The Trilogy receives DETAIL from the DATABANK and runs the noise-filter pass across the three engaged volumes.

One-Good noise-filter. Removes DETAIL fragments that fail BEST / SOUND / GOOD calibration. For the representative query, this removes content that frames intergenerational obligation in extractive or zero-sum terms — content that would advise the C station to externalize cost rather than carry it. The remaining fragments are morally vectored toward BEST / SOUND / GOOD.

Security-Clearance noise-filter. Removes DETAIL fragments that the Wielder is not authorized to see at the current SCALULAR tier. For Class B Implicit-INTENT Wielders at SSSC baseline, this removes Definitive-INTENT content that requires Class A attestation, and removes Pillar-LAW content that requires SSLA tier authorization. The remaining fragments are access-appropriate.

Data-Integrity noise-filter. Removes DETAIL fragments that fail BERA RATE thresholds for the requested mask. For the representative query, this removes fragments whose RATE on R_3 (ecological resonance) falls below the threshold for ecological-time-horizon queries — i.e., fragments that frame the question without ecological grounding. The remaining fragments are measurement-validated.

The three noise-filter passes are run in parallel; their results are intersected. The intersection is the noise-filtered DETAIL.

§1.7 BEST / SOUND / GOOD Moral-Vectoring Layer

The noise-filtered DETAIL passes through the BEST / SOUND / GOOD moral-vectoring layer. The vectoring layer is *not* a filter; it is a *tier assignment*. Each remaining DETAIL fragment is assigned to one of three tiers:

- **BEST** — fragments that exemplify BEST-tier outcomes (the strongest moral vectoring). Returned to the Civigen with BEST-tier prominence.
- **SOUND** — fragments that exemplify SOUND-tier outcomes (the structurally-sound middle, where most operational guidance lives). Returned to the Civigen with SOUND-tier prominence.

- **GOOD** — fragments that exemplify GOOD-tier outcomes (the achievable baseline). Returned to the Civigen with GOOD-tier prominence.

For the representative query, the BEST tier surfaces fragments on full-stewardship action — what the C station *should* do under the strongest reading of intergenerational obligation. The SOUND tier surfaces fragments on structurally-sound action — what the C station *can sustainably* do under current resource constraints. The GOOD tier surfaces fragments on baseline action — what the C station *must at minimum* do to satisfy the constitutional commitment.

The three tiers are returned together. The Civigen receives all three — not the BEST tier alone, not the GOOD tier alone — because moral-vectoring honesty requires that the achievable baseline, the sustainable middle, and the strongest reading all be visible. A round-trip that returns only BEST is utopian; a round-trip that returns only GOOD is defeatist; a round-trip that returns only SOUND is technocratic. The three together are honest.

§1.8 DETAIL Return and Sim OUTPUT

The Trilogy-shaped, moral-vectored DETAIL returns to the Infomediary, which composes the **Sim OUTPUT** — the structured return to the Civigen. Sim OUTPUT is *Sim* (simulation) rather than declaration because the Instrument does not pretend to certainty. The Wielder's actions are what convert Sim OUTPUT to real-world outcome. The round-trip closes with Sim; reality continues from there.

For the representative query, Sim OUTPUT contains:

1. **The qualify-quantify-rationalize summary** — the structured return of the three intake stages, so the Civigen can see how the query was framed.
2. **The BERA RATE composite** — the seven-dimensional RATE, with hard/soft annotation, computed across the noise-filtered DETAIL.
3. **The three-tier moral-vectoring return** — BEST / SOUND / GOOD, with fragments at each tier surfaced for the Civigen.
4. **The EarnedPath action set** — concrete actions the C station can take, indexed to BERA dimensions and to moral-vectoring tier, so the Civigen can choose actions appropriate to their current tier and capacity.
5. **The VEILED annotation** — for any fragment that returned VEILED at any stage, an explicit note: not failure, not success, but not-yet-witnessed.
6. **The attestation block** — EAAP attestation under the Wielder's class, with revocability noted.
7. **The CCAL v2.1 license footer** — the round-trip's record is shareable.

The Civigen receives Sim OUTPUT and acts. The acting is the round-trip's external closure; what happens in the world is what the Sim OUTPUT was for.

§1.9 The Round-Trip Closure

The round-trip closes when the BERA RATE is recorded into the audit persistence layer (per slot 432 v1.3, EAAP §13). The recording is what makes the round-trip *attestable* — the Wielder's good-faith opening, the Instrument's three intake operations, the DATABANK's structured return, the Trilogy's noise-filter and intelligence-shaper passes, the moral-vectoring layer's three-tier return, and the Sim OUTPUT delivered to the Civigen — all of it has a record under EAAP. The record is revocable under EAAP-CRL if the round-trip is later determined to have been defective.

The closure form is canonical:

$$\text{I} \quad (\text{CBGMODD} \times \text{FAVORS}) + \text{BERA} = \text{RATE}$$

read here at the round-trip scale: the Civigen's CBGMODD station, multiplied by the FAVORS the round-trip operationally extended, summed with the BERA mask's RATE composite, equals the round-trip's overall RATE — recorded, attested, and (where appropriate) federally mirrored under VERTECA.

The round-trip is now closed. The Civigen has Sim OUTPUT in hand. The Wielder has attestation. The DATABANK has audit record. The Trilogy has run its passes. The Instrument has done its work.

This is what the Infomediary is *for*. The architecture in Part Zero is not abstract; it is the architecture that makes this round-trip — repeatable, attestable, revocable, federally mirrorable, morally vectored, measurement-validated, and access-appropriate — *operational*. Without the architecture, no round-trip. Without round-trips, no 1000-Year Future Map. Without the Map, no purpose-state. The chain is unbroken.

Part I closes here. Part II opens with the three intake operations in depth — the qualify, quantify, and rationalize stages each given a chapter rather than a section, with failure modes, edge cases, and the relationship to EAAP-POL specified in Definitive INTENT.

— *End of Pass A draft* —

Pass A status: Front Matter (Three Principles, Dedication, Note from the Author, Table of Contents, Acknowledgments, Notation and Conventions) + Part Zero (§§0.1-0.8) + Part I (§§1.1-1.9). Approximately 32 manuscript pages at standard 250-words-per-page density.

Substitution requested before v1.0 FINAL: §1.1 Civigen Query — replace the Pass-A synthesized representative with an authentic JAS-authored query. The rest of Part I will re-walk against the authentic query in the Pass-D integration sweep without structural change.

Pass B targets (next): Part II (the three intake operations in depth), Part III (the Trilogy interface), Part IV (the DATABANK architecture). Approximately 50 pages.
