

May 2026

1. Logline (cornflakes packet version)

What: A biometric signature and governance protocol that ties identity, consent, and action to an immutable, byte-normative standard.

Problem solved: Current digital systems cannot verify *who actually authorized what, when, and under what conditions* — leading to fraud, legal ambiguity, and lost human accountability.

2. Three business scenarios

Scenario	Business problem	Pain point	How ERES solves it
Banking / POS	Card-not-present fraud	\$32B+ annual losses; voice/AI spoofing	Voice biometric + EAAP attestation ties each transaction to a live, signed biometric event
Smart city access	Identity sprawl across water, power, shelter services	No single source of truth; vulnerable to credential theft	ERES GraceChain links civic services to a user-managed biometric key
Government credentialing	Manual identity verification for benefits	Slow, costly, prone to social engineering	Real-time attestation without central credential store; non-punitive remediation path

3. Six-slide overview (summary)

1. Problem – Identity is broken. Attestation is assumed, not proven.
 2. Solution – ERES EAAP + biometric signature + byte-normative test vectors.
 3. Architecture – Hybrid (cloud or air-gapped), integrates with AD and LDAP via MIEVM.
 4. Administration – Role-based governance, no single admin override without biometric quorum.
 5. Cyber stance – Hardened by multi-instance ensemble validation; no plaintext secret storage.
 6. Next step – Pilot-ready for civic or financial use case with an angel partner.
-

On realizability:

ERES is currently at TRL 5-6 (technology validated in relevant environment). What is missing is not the protocol – that is fully specified and tested – but a commercial or civic partner to fund and host the first live, non-simulated deployment.

If you are open to it, I would welcome a 30-minute call to walk you through the 6 slides and answer your AD/cyber/admin questions directly.

Respectfully,

Joseph A. Sprute

6-Slide Overview – Realizable Product & Service

Prepared for: ERES Angle

Prepared by: Joseph A. Sprute

Date: May 2, 2026

Slide 1 – The Problem We Solve

Title: Identity & Attestation Are Assumed, Not Proven

- Every day, systems assume *"the person who logged in is the person who authorized the action"*
- Passwords, tokens, and even most MFA can be stolen, spoofed, or socially engineered
- Result:
 - Fraud disputes with no definitive proof
 - Legal contracts signed without *continuous* consent
 - No audit trail that ties an action to a *specific human biometric event in real time*

Pain point in one sentence:

You cannot prove, beyond reasonable doubt, that a specific human authorized a specific transaction at a specific moment.

Slide 2 – What ERES Is (The Logline)

Title: A Biometric Attestation & Governance Protocol

Logline (cornflakes packet version):

ERES ties your unique bio-electric signature to every action you approve – creating an unforgeable, time-stamped record of who said yes, to what, and when.

What it is not:

- Not a blockchain for its own sake
- Not another password manager
- Not a mass surveillance tool

What it actually is:

- A byte-normative standard (EAAP v1.2+)
 - A lightweight attestation protocol that works with existing systems (AD, LDAP, cloud, on-prem)
 - A governance layer that enables legal and civic remediation without punishment as the first tool
-

Slide 3 – How It Works (Non-Technical)

Title: Three Simple Steps Per Action

Step	What Happens	Human Experience
1. Intent	User indicates they want to approve something (payment, login, document, access)	Tap, click, or voice command
2. Biometric Signature	ERES captures a live bio-electric or voice sample (not stored as raw data)	Speak a short phrase or touch a sensor
3. Attestation	Protocol generates a signed, time-stamped, non-repudiable receipt	Nothing – happens in <1 second

Result:

A court-admissible, auditable proof that *this person* approved *this action* at *this time*.

Slide 4 – Three Business Scenarios (Real World)

Scenario	Industry	Business Problem	ERES Solution
1. Card-not-present fraud	Banking / Retail	\$32B+ annual fraud losses; voice deepfakes are rising	Voice biometric attestation per transaction. No voiceprint = no approval.
2. Smart city service access	Municipal / Civic	Same person uses water, shelter, power, food — each with separate credentials	One biometric signature across all services. Reduces fraud, speeds aid.
3. Government benefit claims	Federal / State	Fake identities and credential sharing cost billions	Live attestation at each claim step. Non-punitive remediation path for honest errors.

Slide 5 – Technical Fit (For Your IT & Cyber Teams)

Title: Plugs Into What You Already Have

Question	Answer
Cloud or on-prem?	Both. Hybrid first. Air-gapped possible.
AD / LDAP integration?	Yes. Works as an attestation provider alongside existing directories.
Administration	Role-based. No single admin override without biometric quorum.
Cyber posture	Hardened via MIEVM (Multi-Instance Ensemble Validation Method). No plaintext secrets. Byte-normative test vectors.
Deployment effort	Pilot: weeks, not months. No rip-and-replace.
Current readiness: TRL 5–6 (validated in relevant environments) Missing piece: First live pilot with a commercial or civic partner (this is where you could help)	

Slide 6 – What We Need & What You Get

Title: Angel Partner – Not Just Investment

What we need:

- One real organization willing to run a 90-day pilot (bank, city, or government agency)
- Lightweight governance support (introductions, credibility, strategic cover)
- Optionally: help connecting with Emanuel M. Alexiou for Colina / Bahamas opportunity

What you get as partner:

- First-mover advantage in biometric attestation standards
- Co-ownership of the pilot results and published case study
- Direct input into the ERES governance framework
- A defensible, non-speculative technology with actual test vectors and specifications

Closing line for Angel:

Be leader over SELF-\$ELF M+E = HowWay: AnswerQuestion.IT.MyWay
