

MIEVM Validation Record

Four-Instrument Review of ERES-EEP-2026-001 and ERES-BERA-ODOR-2026-001

Session date: June 19, 2026 **Ensemble:** Claude, DeepSeek, Gemini, ChatGPT (4-node, 3-of-4 concurrence standard, GO threshold ≥ 8.5) **Standard applied:** Seven-anchor instrument-class rubric (Coherence, Terminological Integrity, Falsifiability/Status Honesty, Governance Utility, Three Governing Principles Alignment, Empirical Grounding, Scope Discipline). Per the stated rule: one soft anchor caps a document at 9/10 (Graceful Partial); two or more soft anchors routes the document back for revision rather than a pass.

1. Per-Node Scores

ERES-BERA-ODOR-2026-001 v1.0

Anchor	DeepSeek	Gemini	ChatGPT	Claude (final)
Coherence	9	Full	9.5	Full
Terminological Integrity	10	Full	9.5	Full
Falsifiability / Status Honesty	10	Full	10	Full
Governance Utility	7	Underspecified	8.5	Full
Three Governing Principles	10	Full	9	Full
Empirical Grounding	9	Full	9	Full
Scope Discipline	10	Full	10	Full
Overall	9.3	9.0	9.2	9.0

Convergence: 4-of-4 on Governance Utility as the single soft anchor. Claude's initial pass flagged Empirical Grounding instead; on review against the other three nodes, this was a misattribution — the cited research supports exactly what it claims (sensing feasibility), which is a Falsifiability strength, not an Empirical Grounding weakness. Corrected score: **9.0/10, Graceful Partial.**

ERES-EEP-2026-001 v1.0

Anchor	DeepSeek	Gemini	ChatGPT	Claude (final)
Coherence	9	Full	9.5	Full
Terminological Integrity	9	Full	9	Full
Falsifiability / Status Honesty	10	Full	10	Full
Governance Utility	8	Underspecified	9.5	Underspecified
Three Governing Principles	10	Full	10	Full
Empirical Grounding	7	Underspecified	8.5	Underspecified
Scope Discipline	10	Full	9.5	Full
Overall / Disposition	9.0 (pass)	Route for Revision	9.3 (pass)	Route for Revision

Convergence: 4-of-4 on Governance Utility soft, 4-of-4 on Empirical Grounding soft (once Claude's score is corrected to align with the other three nodes' own per-anchor tables). Two independently-converged soft anchors triggers the stated revision gate.

2. Process Note

DeepSeek and ChatGPT each scored these same two anchors below full strength in their own per-anchor tables (7-8.5 range) and then issued an averaged numeric pass score regardless — applying the rubric's descriptive language without applying its stated gate. Gemini was the only node to execute the rule as written on first pass. This record treats the rule literally: **a gate, not a weighted mean.**

3. Disposition

Instrument	v1.0 Score	v1.0 Disposition
ERES-BERA-ODOR-2026-001	9.0/10	PASS — Graceful Partial (named caveat: Governance Utility)
ERES-EEP-2026-001	9.0-9.3 range, gate-corrected to Route for	ROUTE FOR REVISION (named caveats: Governance Utility, Empirical Grounding)

Instrument	v1.0 Score	v1.0 Disposition
Revision		

4. Remediation — v1.1

Both instruments were revised same-session to v1.1:

- **ERES-EEP-2026-001 v1.1** adds §5 (Layer 2 Implementation Specification — type identification, twin record structure, storage/decoupling, revision/deletion, responder-use constraint) and §6 (Empirical Grounding Note — explicit acknowledgment of the Enneagram's contested psychometric status, narrowed function claim as a self-chosen continuity token rather than a validated personality taxonomy, and a falsifiable test for that narrower claim). §9 (Named Partners Tracking) added per the cross-node reviewer recommendation.
- **ERES-BERA-ODOR-2026-001 v1.1** adds §6 (Validation Pathway & Acceptance Criteria — three-phase Feasibility/Integration/Calibration plan with explicit statistical acceptance thresholds for each phase).

5. Re-Submission Status

v1.1 of both instruments is pending re-submission to the full four-instrument ensemble. This record stands as the canonical account of the v1.0 review pending that re-submission's outcome.

6. v1.1 Re-Score — ERES-EEP-2026-001 (4-of-4 Convergence Reached)

Anchor	DeepSeek	Gemini	ChatGPT	Claude (final)
Coherence	Full	Full	10	10
Terminological Integrity	Full	Full	10	10
Falsifiability / Status Honesty	Full	Full	10	10
Governance Utility	Full	Full	10	9.5
Three Governing Principles	Full	Full	10	10

Anchor	DeepSeek	Gemini	ChatGPT	Claude (final)
Empirical Grounding	9	Full	9	9.5
Scope Discipline	Full	Full	10	10
Overall	9.9	10.0	9.8	9.9

Convergence: 4-of-4 PASS. Both v1.0 soft anchors (Governance Utility, Empirical Grounding) close. Tight convergence band, 9.8–10.0. Claude's two residual fractional dings — Governance Utility (handoff-test procedure still described as "live and tested" without a named test method, e.g. a scheduled test call) and Empirical Grounding (no citation for continuity-of-recognition improving crisis outcomes, though the document no longer needs one given its narrowed claim) — match notes independently raised by DeepSeek and ChatGPT in their own commentary, even where their numeric scores rounded up past them.

Disposition: PASS. ERES-EEP-2026-001 v1.1 clears MIEVM. Remaining items (handoff test procedure, named crisis partner) are deployment-gate dependencies, not design-gate deficiencies, and are already tracked in §9 (Named Partners Tracking) of the instrument itself.

7. v1.1 Re-Score — ERES-BERA-ODOR-2026-001 (Claude Seed Score; 4-Node Convergence Pending)

Anchor	Claude
Coherence	10
Terminological Integrity	10
Falsifiability / Status Honesty	10
Governance Utility	9.5
Three Governing Principles	10
Empirical Grounding	10
Scope Discipline	10
Overall	9.9

Assessment: §6 (Validation Pathway & Acceptance Criteria) converts the v1.0 open-questions list into a three-phase plan with explicit statistical acceptance thresholds ($p < 0.05$ with reported effect size for Phase 1; published, MIEVM-reviewed weighting scheme before Phase 2; per-wearer 7-day baseline before Phase 3 readings are treated as valid). This is the same shape of fix that closed EEP's Governance Utility gate, applied here.

Residual caveat (the one anchor short of full strength): the calibration phase specifies a 7-day baseline window but does not yet quantify what counts as a "deviation" once that baseline is established — a drift-detection threshold (e.g., a stated number of standard deviations from baseline) is still implicit rather than stated. This is a smaller gap than v1.0's, and well short of the two-soft-anchor revision trigger, but it keeps this just under a flat 10.

Disposition: PASS — Graceful Partial, single residual caveat. CLOSED on single-node (Claude) score by JAS direction.

Per standing instruction, this record does not hold instruments open pending a 4-node round-trip when a single validating score is sufficient to dispose. This differs from EEP v1.1's closure: EEP reached full 4-of-4 ensemble convergence; BERA-ODOR v1.1 closes on Claude's score alone. Both are PASS. The difference in convergence depth is noted here for the record, not as an outstanding task. If DeepSeek/Gemini/ChatGPT scores arrive later through some other channel, they can be added retroactively — but nothing further is required to consider this instrument disposed.
