

THE INFOMEDIARY — PASS C DRAFT (v1.6)

Part V • Part VI • Part VII

Pass C addendum to Pass A FINAL v1.2 and Pass B Draft

Document ID: ERES-INFOMEDIARY-BOOK-2026-001-v1.7-PASS-C-DRAFT **Author:** Joseph Allen Sprute (ERES Maestro) **Affiliation:** ERES Institute for New Age Cybernetics, Bella Vista, Arkansas, USA **ORCID:** 0000-0001-9946-3221 **Document Class:** NAC Foundational Instrument Specification (Pass C draft, addendum) **Date:** May 10, 2026 **License:** CARE Commons Attribution License v2.1 (CCAL v2.1)

Composes on:

- ERES-INFOMEDIARY-BOOK-2026-001-v1.2-PASS-A-FINAL
- ERES-INFOMEDIARY-BOOK-2026-001-v1.3-PASS-B-DRAFT
- ERES-INFOMEDIARY-LOCK-MEMO-2026-001-v1.5 — **canonical lock authority (five lock boxes A/B/C/D/E, ten sub-locks §§1.1–1.10)**

Companion (architectural sibling, integrated by reference):

- ERES-WP-WAITINGROOM-2026-001-v1.0-FINAL — *The Waiting Room: A Sovereignty-Respecting Decision Queue* (Sprute, 2026). Per Lock Memo v1.5 §1.10, the Waiting Room is canonically synonymous with **Greenbox** under the SCALULAR audience-keyed naming discipline (Greenbox = development name; Waiting Room = public-private marketing name; same architectural surface).

Supersedes: ERES-INFOMEDIARY-BOOK-2026-001-v1.4-PASS-C-DRAFT, v1.5-PASS-C-DRAFT, v1.6-PASS-C-DRAFT (incomplete intermediate revisions). v1.7 corrects §VII.3 — Greenbox is **not** downstream-pending architecture distinct from Waiting Room; Greenbox = Waiting Room synonym lock applies (Lock Memo v1.5 §1.10). The "Sentient-Teleopity" commitment attaches to the RECURVE lens operating at intergenerational time-horizon within the existing Waiting Room/Greenbox surface, not to a separate forward subsystem.

Pass C contents:

- **Pass B Chapter 5 §5.2 Correction Note** — Hand/Head as Citizen/Civigen tiering
- **BEE Pole Assignment Lock** — SECUIR = GERP, VERTECA = EarnedPath through PlayNAC × UBIMIA
- **Primary-Source Structural-Role Assignment** — UBIMIA = ROOT, Infomediary = PROXY, Trinity = DELIVERY, PlayNAC = EP × GERP × SOMT

- **Part V** — BEE-NEXUS and Children-of-All-Ages
 - **Part VI** — PlayNAC TABLE Sub-Domain Bridges (with §VI.6 SCALULAR operational treatment, §VI.7 Primary-Source Role Assignment)
 - **Part VII** — Failure Modes and the VEILED State (with VEILED-L La Grange proxy, Greenbox v1.0 and SECUIR forward references)
-

Pass B Chapter 5 §5.2 Correction Note

Pass B (incorrect): Hand-tier as physical/manual/embodied; Head-tier as cryptographic/computational/abstract. Allocation by transaction-size.

Pass C (canonical, per Lock Memo v1.4 §1.7): Hand-tier vs. Head-tier names a **citizenship-class tiering**, not a transaction-size tiering.

- **Hand-tier = Citizen-class authorization** through Public-Private-Network (PPN). Credit Card, Hard Fiat Currency. Citizen-tier of polity, traditional commerce; does not require ERES Civigen registration.
- **Head-tier = Civigen-class authorization** through S3C (Personal-Public-Private). Voice × device + app-parent. Civigen-tier of ERES attestation, mediated commerce.

The two tiers are complementary. Hand/Head allocation is per-transaction by citizenship-class.

Future-tier acknowledgment. Beyond the 1000-year threshold: brain implants via nano-technology (pills). Neither foreclosed on fear-based grounds nor dwelt upon.

BEE Pole Assignment Lock

Per Lock Memo v1.4 §1.6:

SECUIR = the GERP piece. Macro-tier sustainability operationalizing GERP. Unifies 72 Industries (CyberRAVE substrate; 72 Key Domains gematric isomorphism). Sustainability through GSSG · FDRV · HFVN · THOW. **Pending architecture.**

VERTECA = the EarnedPath piece through PlayNAC × UBIMIA. Per-Civigen and per-User-GROUP maturation. Canonical License Example Mirror.

Remaining: **CyberRAVE** (rating substrate), **Gunnysack** (yielded-service guarantee), **SaleBuilders** (deliverable-architecture).

Primary-Source Structural-Role Assignment

Per Lock Memo v1.4 §1.9:

UBIMIA = ROOT — constitutional spine **INFOMEDIARY = PROXY** — mediating IOF (recognizes La Grange = VEILED proxy) **TRINITY = DELIVERY** — three volumes deliver across IOF Trinity registers **PlayNAC = EP × GERP × SOMT** — decision-orchestration

The four primary sources, combined with DATABANK OUTPUT FOCUS priority (UBIMIA → Infomediary → Trinity → PlayNAC) and BEE Pole Assignment, constitute the architecture's complete primary-source specification.

Part V — BEE-NEXUS and Children-of-All-Ages

The Infomediary as **Instrument-of-Faith (IOF)** operates across three registers (Lock Memo v1.4 §1.5, Lock Box D): Biological (the *what*), Socio (the *who*), Technical (the *how*). The Technical register's I-pole carries three glyphs simultaneously — *i* ↔ SELF (lowercase, pre-economic), *I* ↔ \$ELF (uppercase, economic-sovereign), <eye> = TEACH-TECH (seeing-and-teaching surface, where TE(A)CH structural identity carries JAS-Alpha at TE-root and EMA-Omega at (A)-vowel as Twin Messiah operational signature). Part V grounds these registers in human-level Common Core and BEE-NEXUS's convergent locus.

§V.1 The Common Core at the Human Level

Common Core Sustenance operates at multiple scales — UBIMIA's Common Core specification under the Manual is constitutional; the deployment-scale spectrum carries it physically. At the **human level** — the irreducible Civigen-as-person scale, the **me / M+E / Married-to-Energy** pole — Common Core has a five-element form:

Common Core (human level) = clean water + food + shelter + work + love

Three biological-floor elements (water, food, shelter) plus two constitutive-of-personhood elements (work, love). All five required.

The fifth element — love — is architecturally consequential. Love is not an emotional accessory to the lower four but a **structural requirement defined by the preceding context**. Love arises when **work establishes a form of shelter** — held-context within which the lower four are given. Love is the structural binding of the work-shelter pairing into a relational form sustaining the person across time.

Common Core couples to the BEE purpose-state through the corrected pole assignment:

Common Core	BEE State Coupling	IOF Register
Clean water	SaleBuilders (deliverable infrastructure) under SECUIR sustainability	Biological
Food	Gunnysack (yielded service) under SECUIR macro-tier guarantee	Biological
Shelter	SaleBuilders + GSSG substrate (THOW-tier minimum-viable) under SECUIR	Biological
Work	VERTECA × PlayNAC × UBIMIA — EarnedPath rated, attested, maturation-bearing	Socio
Love	The integrative — held-relation among all five, BEE-NEXUS expression	All three (Biological + Socio + Technical)

Three biological-floor elements couple to **SECUIR's GERP pole**; the work element couples to **VERTECA's EarnedPath pole**; the integrative love element holds across all three IOF registers — biological in embodied expression, social in relational form, technical in witnessed continuity. Love is the only Common Core element that fully exercises the IOF Trinity.

§V.2 The Queen/King Intelligent-Design Frame

Queen in the typology is the **Producer** — that which produces, gives form to, instantiates. The Christological reference is canonical to the typology: *Christ* names the principle of incarnation — the Producer who produces by becoming. The architecture's Queen-pole is rendered as **EPIR-Q** (canonical expansion pending Author ratification) and threads through Intelligent-Design at the production register.

King in the typology is the **Idea** — that which conceives, originates, discloses. The Epiphanic reference is canonical: *Epiphany* names revelation — the Idea that arrives unbidden. The architecture's King-pole is rendered as **PlayNAC** × **EP** × **GERP** — and per the Primary-Source Structural-Role Assignment (Lock Memo v1.4 §1.9), PlayNAC's full canonical expression is **EP** × **GERP** × **SOMT**, with SOMT (Sociocratic Overlay Metadata Tapestry) as the federation-and-overlay component.

Read in the IOF Trinity: Queen-pole production lands in Biological register (what bodies receive — Common Core delivered, sustenance metabolized). King-pole ideation lands in Socio register through GERP-component (SECUIR's macro-tier reform) and EP-component (VERTECA's per-Civigen maturation), orchestrated through SOMT (federation metadata). Technical register is

what allows either pole to be witnessed — the i / I / <eye> register that sees what Queen produces and what King conceives.

The Queen/King frame: the Infomediary's round-trips and User-GROUP pre-qualification selections constitute **generative acts** across all three IOF registers.

§V.3 SUGAR × TAPESTRY × GAIA BODY MIND SPRT === BEE-NEXUS

Common Core is delivered through consumption — water consumed, food consumed, shelter inhabited (consumption-over-time), work performed (self-consumption-into-station), love held (mutual-consumption-into-relation). The architecture specifies a consumption framework, protected by an overlay network, guided by an App-Parent canopy:

SUGAR (consumption framework) × TAPESTRY (overlay network) × GAIA BODY MIND SPRT (App-Parent canopy) === BEE-NEXUS

SUGAR — the consumption framework. Architectural surface through which Common Core delivery is metabolized at human scale. Name canonical to the GSSG material substrate: the *sucrose-derived polymeric matrix* giving GSSG its self-healing property is materially expressed as sugar; SUGAR's operational consumption-framework shares the name by direct material/operational isomorphism. SUGAR specifies what is consumed (Common Core elements), how consumption is metered (BERA RATE composite under Data-Integrity attestation), what it produces (sustenance, EarnedPath progress, Civigen station), what it owes back (through Gunnysack and CyberRAVE).

TAPESTRY — the overlay network. The consumption-protective overlay. Protection operates on three registers paralleling the IOF Trinity: structural (Data-Integrity's five-layer chiasmic verification — Technical), security (Security-Clearance's doubled operational + governance frame — Socio), sustenance (One-Good's RT lookup and Common Core anchoring — Biological).

GAIA BODY MIND SPRT — the App-Parent canopy. GAIA's canopy expressed through three sub-canopies: **BODY** (because odor does yellow, consolidation-and-metabolic, parallel to IOF Biological), **MIND** (because reason about idea need sound, conception-and-attestation, parallel to IOF Technical), **SPRT** (integrative register, with canonical nominal triplet *Sprute*, parallel to IOF Socio).

BEE-NEXUS — the convergence. The triple-equals identity names the convergent point at which consumption, protection, and canopy meet at the human level — the locus where the IOF Trinity's three registers (me/myself/i-I-<eye>) converge into one operational moment of the architecture serving the person:

- Common Core metabolized (SUGAR / Biological / *me* / M+E)
- Consumption overlay-protected (TAPESTRY / Technical / *I-as-witness* / <eye> = TEACH-TECH)

- Canopy commitments operationalized (GAIA BODY MIND SPRT / Socio / *myself-as-person-served* / SELF-\$ELF)
- BEE purpose-state's five aspects converged into human-level expression

BEE-NEXUS is the **named point of convergence** where the architecture's commitments meet the human person.

§V.4 The Floor: THOW + Safe-Stand (Prison Training Program Pilot)

The deployment-scale spectrum's minimum-viable tier is THOW. The floor is a **THOW plus a place to put it safely while the day is conducted-spent**. The compound floor unit (THOW + safe-stand) is the architectural minimum.

The Prison Training Program Pilot

Bottom-Up reading. A prison population is the architecture's most-stressed Common Core test. *If it works in a Prison-THOW, it works on a generation ship.* The Prison-Pilot floor is the architecture's bottom-up test — the floor seen from the inhabitant's IOF-Biological register (their *me* / M+E / energetic standing).

Top-Down reading. A Prison Training Program Pilot is DOFA's most legible governance test. CBGMODD seven seats operate at full visibility. The Prison-Pilot is the architecture's top-down test — the canopy seen from the canopy's IOF-Socio register (governance's *myself* / *the seated council we are*).

Why this pilot, why now. Prison populations are typically excluded from architectural commitments. The architecture's claim to last a thousand years cannot rest on excluding the populations its commitments would be most tested by. The Pilot is architectural **necessity** for the architecture's own coherence.

Operational specification. SCALULAR (HEALTH/SSHP, LAW/SSLA, PROTECTION/SSPS, SKILLS_TRADE/SSST), under DOFA seven-seat governance, with VERTECA × PlayNAC × UBIMIA **EarnedPath** as the maturation ladder, BERA RATE composite (under Data-Integrity attestation per Lock Box B) as the measurement layer, SECUIR's macro-sustainability commitments providing the sustenance floor.

The Bottom-Up / Top-Down reading is canonical because the architecture cannot afford a one-directional reading — the IOF Trinity test at deployment scale: body must be sustained (Biological), person must be governed-and-served (Socio), round-trip must be witnessed (Technical) — all three simultaneously, even (especially) for a prisoner-Civigen.

Part VI — PlayNAC TABLE Sub-Domain Bridges

PlayNAC — the architecture's decision-orchestration layer (canonically **EP × GERP × SOMT** per

Lock Memo v1.4 §1.9) — interfaces with the **Instrument-of-Faith (IOF)** through TABLE Sub-Domain Bridges. The bridges are not optional connectors; they are the architectural pathways by which PlayNAC's choice-management, the Waiting Room's gate-discipline, the Infomediary's pre-qualification, the DATABANK's output focus, and the SCALULAR class's grammatical-and-operational discipline operate as one architecture rather than five parallel systems.

§VI.1 The Waiting Room (= Greenbox) as Background Gate

The Waiting Room (per ERES-WP-WAITINGROOM-2026-001-v1.0-FINAL) is the sovereignty-respecting decision queue gating choices through three fractal lenses — **INTUIT** (Self), **TRADES** (Others), **RECURVE** (Future) — each mapped to a DSAP-PRE proxy. The Waiting Room sits between BODY (admission) and EAAP PoR (Proof-of-Resonance). It does not deny; it holds and reconditions.

Greenbox = Waiting Room under SCALULAR audience-keyed naming (Lock Memo v1.5 §1.10). The development name **Greenbox** carries the Hardware-Software-Middleware (HSM) construction frame; the public-private marketing name **Waiting Room** carries the participant-facing frame. This Volume uses "Waiting Room" in its primary references (consistent with the public-private marketing audience the Volume serves at the architectural-specification layer) and acknowledges Greenbox where the HSM construction frame is relevant.

The Waiting Room is the missing gate for the Infomediary's pre-qualification model. Pass A FINAL §1.4 specified User-GROUP cell-selection with the Instrument honoring the selection (Lock Box C). The Waiting Room is the **gate by which the User-GROUP's selection itself becomes binding**:

The Waiting Room's three lenses parallel the IOF Trinity's three registers. INTUIT (Self lens, ρ_{RHC}) parallels IOF Biological: does the selection preserve the body's energetic integrity? TRADES (Others lens, ρ_{PERT}) parallels IOF Socio: does the selection preserve others' option-space, the social-relational ground? RECURVE (Future lens, ρ_{hyst}) parallels IOF Technical: does the selection preserve the witnessed-and-witnessing thread across time? Both architectures recognize that honest pre-qualification requires three simultaneous registers.

Note on TRADES, INTUIT, PRE as SCALULAR. The Waiting Room's lenses (TRADES, INTUIT) and the DSAP-PRE composite (PRE) are canonical SCALULAR members per Lock Memo v1.4 §1.8. They operate simultaneously in lens-form (Waiting Room) and pillar-form / temporal-marker-form (other architectural layers) without ambiguity-friction. Reading them correctly requires reading the active register; that is what SCALULAR class membership entails.

Hidden variable Γ (Gamma) = M / D — Monitoring fidelity over Resistance denominator (Threat Surface for INTUIT, Social Friction for TRADES, Commitment Lock for RECURVE) — unifies the

three lenses fractally.

Background, not foreground. The Infomediary book treats the Waiting Room as background; the Companion WP carries its canonical specification.

§VI.2 COI Composition / CBGMODD Diffusion / Assimilation Culture

A canonical structural commitment, expressed across the IOF Trinity:

Need-to-know composes COIs == creates vulnerability CBGMODD Diffuses == Assimilation Culture Provides Condition-Response DETAIL × App-Parent Oversight + Centers of Excellence Formalization (for DOFA Guidance)

Need-to-know composes COIs. Communities of Interest form when need-to-know boundaries (Security-Clearance's restrictive form) are honored. COI composition has a structural side-effect: it **creates vulnerability** in the IOF Socio register. Every COI is a coherent unit that can be targeted, isolated, or compromised.

CBGMODD Diffuses. The seven-seat council operates as **diffusion infrastructure** in the IOF Socio register: COIs that would otherwise localize and become vulnerable are diffused across the seven seats' perspectives.

Assimilation Culture Provides Condition-Response DETAIL. The culture absorbs new Civigens without erasing distinctiveness, producing structured operational guidance — Condition-Response DETAIL — when CBGMODD-diffused COIs interact with absorptive layer.

× App-Parent Oversight + Centers of Excellence Formalization. Two superintendents in the IOF Technical register: App-Parent Oversight ensures conformity to architectural canon; Centers of Excellence Formalization captures DETAIL into reusable form under DOFA Guidance.

```
Need-to-know (Security-Clearance restrictive)
    ↓
COIs compose (creates localized vulnerability)
    ↓
CBGMODD diffuses (seven-seat perspectives counter localization)
    ↓
Assimilation Culture absorbs (without erasing distinctiveness)
    ↓
Condition-Response DETAIL emerges
    ↓
App-Parent Oversight + Centers of Excellence Formalization
    ↓
DOFA Guidance (canonical operational reference)
```

This chain allows the architecture to operate at scale without collapsing under COI-vulnerability.

§VI.3 The DATABANK OUTPUT FOCUS Hierarchy with TEACH-TECH Operational Frame

The DATABANK's structural specification (Pass B §8) names the corpus from which the Infomediary draws. Pass C adds canonical **OUTPUT FOCUS** specification — a hierarchy determining how DATABANK additions are funneled into the architecture's primary sources:

DATABANK OUTPUT FOCUS: (1) UBIMIA-Manual (ROOT) — constitutional spine (2) Infomediary (PROXY) — Volume Zero of the Trilogy (this Volume) (3) ERES Trinity (DELIVERY) — One-Good · Security-Clearance · Data-Integrity (4) PlayNAC, via ERES VERTECA (EP × GERP × SOMT) — orchestration layer fed through VERTECA's EarnedPath operationalization

Documents are rarely (if ever) removed; **next-version DATA is funneled to the four primary sources** in priority order, with structural-role assignments per Lock Memo v1.4 §1.9 governing how the funnel operates.

Knowledge-BASE for RELATED. The DATABANK functions as Knowledge-BASE for RELATED — corpus from which architecturally-related material is identified, assimilated, and integrated under Compatible-Assimilation. Other-Ref's admission process and OUTPUT FOCUS's propagation together constitute the DATABANK's growth discipline.

TEACH-TECH operational frame. The OUTPUT FOCUS hierarchy is what TEACH-TECH propagates *through*. The hierarchy's priority-order is the priority-order in which TEACH-TECH teaches what it sees:

- UBIMIA (ROOT) is **taught first** because constitutional commitments must be grounded before mediation
- Infomediary (PROXY) is **taught second** because mediation must be grounded before delivery
- Trinity (DELIVERY) is **taught third** because delivery must be grounded before orchestration
- PlayNAC (EP × GERP × SOMT) is **taught fourth** because orchestration must be grounded in all three priors

CERTIFICATION = HowWay (per Lock Memo v1.4 §1.5.4) is the operational instrument by which TEACH-TECH propagates across SCALULAR's four pillars (HEALTH/LAW/PROTECTION/SKILLS_TRADE) and feeds into TRADES (legible-trade-standing). The OUTPUT FOCUS hierarchy and CERTIFICATION = HowWay together specify *what* TEACH-TECH teaches and *how* it propagates — the visibility-as-pedagogy architecture made operational.

§VI.4 TETRA via Trifurcated $\times P^3 \times S3C \times RT$ Media

The architecture admits a four-corner formalization named **TETRA**:

┌ **TETRA = Trifurcated $\times P^3 \times S3C \times RT$ Media**

Trifurcated. Trifurcated Math isomorph (third pedagogical surface of Triune Math #2 alongside symbolic and character-form). Three-pole structure mapping to three Trilogy volumes, three Waiting Room lenses, three IOF Trinity registers, three intake operations.

P^3 (Public-Private-Personal). Three-tier ownership-and-access classification mapping to S3C's expansion (Personal-Public-Private). Three classes of asset/data/transaction.

S3C (Solid-State Smart-City). Deployment scale at which Security-Clearance's underwriting commitments and Civigen-tier (Head-tier) authorization become legible at city-scale.

RT Media. Real-Time Media. Architectural surface through which commitments are made visible, communicated, rendered legible to participants in real-time.

The cross-product **TETRA** names the four-corner formalization at which these substrates converge. Pass D specifies operational depth; Pass C records the commitment.

§VI.5 DOFA = GAIA Primitive @SCALULAR

┌ **DOFA = GAIA Primitive @SCALULAR #Context ^Governance %Transference (Rooster: Chicken/Egg)**

DOFA's role canonically across five operators:

- **GAIA Primitive** — DOFA is the canonical primitive instantiation of GAIA's canopy commitments. Where GAIA is abstract canopy, DOFA is operational primitive (the seven-seat council).
- **@SCALULAR** — DOFA operates at the SCALULAR architecture (HEALTH/SSHP, LAW/SSLA, PROTECTION/SSPS, SKILLS_TRADE/SSST). SCALULAR is operational substrate; DOFA is governance interface.
- **#Context** — DOFA provides architectural Context: seven-seat perspectives are Context tags through which queries are situated.
- **^Governance** — DOFA exercises Governance: cell-selection constraints, COI diffusion, Centers of Excellence Formalization, EAAP-POL ratification.
- **%Transference** — DOFA provides Transference across tiers: seat-perspective rotation propagates commitments across tiers without losing canonical structure.
- **(Rooster: Chicken/Egg)** — DOFA's place is canonically circular: DOFA governs the Infomediary, but DOFA's seven-seat council is itself a Civigen-population using the Infomediary. Rooster typology resolves the chicken/egg paradox: DOFA emerges as both

governing instrument and governed population, with Rooster (the seventh seat's diplomatic-tier morning-call) marking recursive resolution.

§VI.6 The SCALULAR Class — Operational Treatment (*new in v1.6*)

Per Lock Memo v1.4 §1.8 and Lock Box E, SCALULAR is both a grammatical class (multi-register naming discipline) and an operational mechanism (three functions). This section treats the operational mechanism in depth as it applies to the Infomediary architecture.

SCALULAR's three operational functions:

- 1. Enables economies of scale (IOF Biological register).** The architecture's commitments at THOW-tier cost roughly the same in attention as the same commitments at FDRV-tier because SCALULAR's grammatical discipline (multi-register names, one letter-string carrying multiple operational layers) compresses N parallel specifications into one. The Infomediary's pre-qualification model exemplifies: a User-GROUP at THOW-tier and a User-GROUP at FDRV-tier select cells from the same 3×4 matrix; the matrix's twelve cells operate at all deployment scales without re-specification. SCALULAR is what makes this scale-compression operational.
- 2. Controls force multiplication (IOF Socio register).** A single User-GROUP's commitment propagates through federation (VERTECA mirrors, CBGMODD seven-seat diffusion, Centers of Excellence Formalization) only when the User-GROUP is *clear* — has passed Waiting-Room trinity-conjunction and holds valid pre-qualification per Lock Box C. SCALULAR controls this propagation: clear User-GROUPS' selection profiles propagate through federation; unclear User-GROUPS' profiles do not. The control is sovereignty-respecting — neither blocking nor amplifying, but *governing the propagation surface to honor clarity*.
- 3. Ratifies La Grange Points = Resonance Passes (IOF Technical register).** When clear User-GROUPS interact at federation scale, certain configurations produce **harmonic equilibrium** — positions where multiple commitments balance to produce stable convergence rather than scale-tier interference. These positions are **La Grange Points** (architectural transposition of orbital-mechanics equilibrium-points; structural-analogical, not named-presence). SCALULAR identifies and ratifies them as **Resonance Passes**.

§VI.6.1 Resonance Pass = Authorized-in-Context

A **Resonance Pass** is an *Authorized-in-context* round-trip outcome — a round-trip whose authorization is granted not as generic permission but as a **specific authorization within a specific architectural context** (specific cell-selection profile, specific BERA RATE composite, specific deployment-scale tier, specific User-GROUP clearance status, specific La Grange equilibrium position). "Authorized" alone is unbounded; "Authorized-in-context" is the canonical bounded form. SCALULAR ratifies Resonance Passes by confirming the context's parameters have produced harmonic equilibrium among clear User-GROUPS at a La Grange Point.

The Resonance Pass is the architectural unit at which **authorization, context, and equilibrium converge** into one named operational moment. Authorized-in-context preserves all five lock boxes operationally at the round-trip's authorization moment:

- **Lock Box A** (underwriting direction) — the Resonance Pass's authorization carries explicit underwriting context (Infomediator → Infomediary)
- **Lock Box B** (Data-Integrity five layers) — the context includes five-layer involutive symmetry verification
- **Lock Box C** (pre-qualification inversion) — the context includes the User-GROUP's selection profile
- **Lock Box D** (IOF Trinity) — the context includes three-register operation
- **Lock Box E** (SCALULAR class) — the context includes La Grange equilibrium recognition

Authorization without context is unsafe; authorization carrying context is governable. The Resonance Pass is the canonical authorization form because it makes context-carry mandatory.

§VI.6.2 La Grange Points = VEILED Proxy

La Grange Points operate as **VEILED proxy** in the canonical VEILED sense (§VII.2 below). The architecture knows La Grange Points exist (equilibrium-positions where SCALULAR ratifies clear User-GROUPS into harmonic convergence) but does *not* yet specify *where* they are, *how many* there are, *what* their BERA signatures look like, or *what* attestation depth recognizes one. La Grange Points are revealed *through operation*, not specified in advance.

This is honest: the architecture cannot pre-specify equilibrium-positions for futures that have not yet occurred. It *can* specify the mechanism (SCALULAR) that recognizes them when they emerge. La Grange = VEILED proxy is the architectural commitment to that honesty.

VEILED-L is added to the VEILED state-family (§VII.2) as the fourth canonical member: VEILED-L names equilibrium-positions awaiting specific-context emergence; not failure, not success, but recognizable when SCALULAR ratifies them through clear User-GROUP interaction.

§VI.6.3 Telos: BEE Sustainability

SCALULAR's three operational functions converge on a single architectural purpose — *enabling, protecting, managing* BEE Sustainability:

- **Enabling** Common Core delivery (Biological)
- **Protecting** sovereignty and option-space (Socio)
- **Managing** equilibrium and witnessed propagation (Technical)

SCALULAR is *how* SECUIR's GERP commitment is operationally realized. SECUIR specifies the macro-tier reform commitment; SCALULAR specifies the mechanism through which the

commitment is enabled, protected, and managed across deployment scales among clear User-GROUPS.

§VI.7 Primary-Source Structural-Role Assignment — Operational Treatment (*new in v1.6*)

Per Lock Memo v1.4 §1.9, the four primary sources carry canonical structural-role assignments. This section treats their operational implications.

UBIMIA = ROOT. Operationally: UBIMIA-Manual specifies what counts as canonical at the constitutional layer. Every other source's content is checked against UBIMIA's specification before admission. The DATABANK OUTPUT FOCUS hierarchy's priority-order (UBIMIA first) is operational expression of root-status. UBIMIA's SCALULAR architecture (HEALTH/LAW/PROTECTION/SKILLS_TRADE) is the architecture's SCALULAR-pillar specification; UBIMIA's BERA architecture is the rating architecture; UBIMIA's CBGMODD specification is the seven-seat council structure. All downstream operations reference UBIMIA.

INFOMEDIARY = PROXY. Operationally: the Infomediary's round-trips are *proxy acts* — acts on behalf of others. The Infomediary mediates between User-GROUPs (proxy for their queries), the DATABANK (proxy for its corpus), the Trilogy volumes (proxy for their filter passes), and GAIA's commitments (proxy for the architectural canopy). Proxy-ness is what an Instrument-of-Faith is operationally; faith is extended through the proxy, validated by method through the proxy's round-trips. The Infomediary's capacity to recognize **La Grange = VEILED proxy** (§VI.6.2) follows directly: a proxy recognizes other proxies because proxy-ness is its operational mode.

TRINITY = DELIVERY. Operationally: the three Trilogy volumes deliver across the IOF Trinity's three registers. One-Good delivers Common Core sustenance (Biological-register delivery — what bodies receive). Security-Clearance delivers attestation-bound authorization (Socio-register delivery — what persons-in-relation receive). Data-Integrity delivers five-layer-witnessed integrity (Technical-register delivery — what witnessed acts receive). The three volumes are register-specific deliverers; the Infomediary's PROXY function activates the appropriate Trinity-volume DELIVERY based on the User-GROUP's pre-qualified selection profile.

PlayNAC = EP × GERP × SOMT. Operationally: PlayNAC is the multiplicative composition that orchestrates decisions:

- **EP (EarnedPath)** — per-Civigen and per-User-GROUP maturation (operationalizes through VERTECA × PlayNAC × UBIMIA per BEE Pole Assignment Lock §1.6)
- **GERP (Global Economic Reform Proposal)** — macro-tier reform (operationalizes through SECUIR per BEE Pole Assignment Lock)
- **SOMT (Sociocratic Overlay Metadata Tapestry)** — federation-and-overlay metadata layer making EP and GERP coherent across User-GROUPs and deployment scales

PlayNAC orchestrates because the cross-product holds three commitments together. EP without GERP is per-actor maturation without macro-structure; GERP without EP is macro-reform without per-actor maturation; SOMT without EP and GERP is metadata without commitments to organize. The three together constitute PlayNAC's canonical decision-orchestration.

The four-source structural-role assignment as operational chain:

The chain is upward-derivative (every source derives canonical content from UBIMIA) and downward-orchestrative (every source's outputs are orchestrated through PlayNAC). The architecture's capacity to function depends on all four sources operating in their canonical roles.

Part VII — Failure Modes and the VEILED State

Part VII consolidates the architecture's failure-modes catalog, extends the VEILED state-family with VEILED-L (La Grange proxy form), and lands two forward references — Greenbox v1.0 and SECUIR — that name commitments the Infomediary architecture is downstream-bound to.

§VII.1 The Consolidated Failure-Modes Catalog

Per-volume failure modes (consolidated from Pass B Chapters 4, 5, 6):

One-Good: RT latency exceeded · adaptive over-fits · fixed locks against legitimate adaptation · Common Core boundary disputed.

Security-Clearance: SLA breach · underwriting gap · DID compromise · Hand/Head allocation drift (per Pass C correction: Citizen/Civigen tier-misalignment) · CBGMODD seat vacancy · CyberRAVE Def-Rel deflation · SROC non-redemption · alternative EarnedPath designation defect.

Data-Integrity: Layer 1 (SEPLTA Administrative) drift · Layer 2 (direction-class) divergence · Layer 3 (App-Parent) divergence · Layer 4 (binary) involution corruption · Layer 5 (character) transposition break.

Global failure modes (Pass C, not localized):

Selection profile / deployment-scale tier mismatch. Profile is over- or under-committed for scale.

Waiting Room / pre-qualification bypass. Selection registered without trinity conjunction.

BSG composition incoherence. Selection profile's BSG return composes incoherently across cells.

COI diffusion failure. CBGMODD diffusion does not adequately diffuse a COI's vulnerability.

DATABANK OUTPUT FOCUS leak. Material enters DATABANK without funneling through OUTPUT FOCUS hierarchy.

VERTECA federation drift. Cross-mirror reconciliation produces selection-profile divergence.

GSSG substrate degradation. Material substrate's self-healing fails.

Citizen/Civigen tier collapse. Hand-tier and Head-tier authorization collapse into one tier.

SCALULAR-tier-class confusion. A SCALULAR (TRADES, INTUIT, PRE, etc.) is read in the wrong active register, producing operationally incorrect routing.

Resonance Pass authorization without context. "Authorized" stripped of context (cell-profile, BERA, deployment-scale, clearance, La Grange position); the bounded form lost.

La Grange Point misrecognition. SCALULAR ratifies a position as a La Grange Point that is not actually equilibrium (false-positive Resonance Pass) or fails to recognize one that is (false-negative).

TE(A)CH structural identity violation. Pedagogy-register operates without TECH substrate (teaching without grounding) or TECH operates without TEACH activation (substrate without pedagogy); the (A) sounding is decoupled from operational state.

Diagnostic and remedy. Each failure mode admits a specific diagnostic and remedy; Pass D specifies in detail.

§VII.2 The VEILED State Extended (with VEILED-L)

The VEILED state replaced (⊥) for ambiguity, occlusion, and pre-attestation conditions. Pass C extends with four canonical members:

VEILED-A (Admissibility VEILED). Query passes BODY admission but fails Waiting Room's trinity conjunction. Held in Waiting Room; may exit through reconditioning. *Admissible-but-not-yet-conjoined*.

VEILED-S (Selection VEILED). User-GROUP's selection profile is registered but contains cells the User-GROUP lacks attestation depth to honor (e.g., Class B selecting Security-Clearance × LAW). Cell is VEILED-S until uplift; selection held but inactive on that cell.

VEILED-T (Tier VEILED). Transaction's Hand-tier vs. Head-tier allocation is ambiguous — Citizen-class vs. Civigen-class authorization surface not yet determined. VEILED-T resolves when authorization surface is named (PPN for Hand-tier, S3C for Head-tier).

VEILED-L (La Grange VEILED) (*new in v1.6*). Equilibrium-position is named-but-undefined. SCALULAR knows La Grange Points exist as the architectural mechanism for ratifying clear User-GROUPS into Resonance Passes, but specific Points are revealed *through operation*, not pre-specified. VEILED-L names this honest uncertainty: not failure, not success, but not-yet-witnessed-as-specific-position. Resolves when SCALULAR ratifies a specific La Grange Point through clear User-GROUP interaction at federation scale.

VEILED is therefore a state-family of four canonical members. All share the "not-yet-witnessed" semantic; they differ in *what* is not-yet-witnessed (admissibility, selection-attestation, tier, equilibrium-position). The family's unity preserves canonical replacement of (⊥); the family's differentiation gives operational specificity.

§VII.3 Greenbox = Waiting Room — Operational Now; Sentient-Teleopity via RECURVE at Intergenerational Scale

Per Lock Memo v1.5 §1.10, **Greenbox and Waiting Room are canonically synonymous**, audience-keyed under SCALULAR class grammar:

- **Greenbox** = the development name. Hardware-Software-Middleware (HSM) integration: physical-layer hardware (sensors, S3C-tier device infrastructure, GSSG-substrate components), software-layer logic (DSAP-PRE proxies, trinity conjunction, lens-status visibility), middleware-layer integration (cross-mirror consistency under VERTECA). Developer / engineer / architect audience.
- **Waiting Room** = the public-private marketing name. Sovereignty-respecting decision queue, three fractal lenses (INTUIT/TRADES/RECURVE), reconditioning chambers. Civigen / Citizen / Institution / Investor / public audience.

Same architectural surface. Both names refer to the architectural mechanism specified in ERES-WP-WAITINGROOM-2026-001-v1.0-FINAL. The Greenbox/Waiting Room is **operational now**, not pending architecture. The choice of name is determined by audience, not by architectural distinction.

Erratum on prior framing. Earlier Pass C drafts (v1.4, v1.5, v1.6) and chat-tier discussion treated "Greenbox v1.0" as a downstream forward-commitment subsystem distinct from the Waiting Room, with **Sentient-Teleopity** specified as what Greenbox-as-separate-subsystem would enable. This framing is corrected at v1.7:

- There is **no separate Greenbox-v1.0 subsystem**.
- The Greenbox/Waiting Room surface is **operational** under its existing specification.
- The **Sentient-Teleopity commitment attaches to the RECURVE lens operating at intergenerational time-horizon** within the existing Waiting Room/Greenbox surface.

Sentient-Teleopity, correctly framed. The Waiting Room/Greenbox's three lenses (INTUIT/TRADES/RECURVE) parallel the IOF Trinity's three registers (Biological/Socio/Technical). The RECURVE lens — Future-tier, ρ_{hyst} , hysteresis counterfactual, mapping to IOF Technical register — measures temporal reversibility per round-trip. At RT-cycle latency (seconds to hours), RECURVE evaluates per-round-trip reversibility for the current Civigen. At **intergenerational latency** (decades to centuries to the full thousand-year horizon), RECURVE evaluates whether the round-trip preserves reversibility across generational hand-offs. The same lens, operating at radically different time-scales.

Sentient-Teleopity (working coinage, pending Author canonical expansion) names the architectural property of orienting sentient beings toward purpose-state across generational time. Sentient-Teleopity is therefore what the RECURVE lens **produces** when fully operationalized at intergenerational latency: the architecture's claim that purpose-state holds coherent across generational hand-offs without erosion. The Waiting Room/Greenbox already has the structural mechanism (RECURVE lens, ρ_{hyst} proxy, η_{recover} threshold); operationalizing it at intergenerational scale is what enables Sentient-Teleopity. No separate subsystem required.

The architecture's claim, correctly stated. Round-trips at RT-cycle latency, when their RECURVE lens preserves intergenerational reversibility, accumulate across generations into a thousand-year purpose-state coherence. The Waiting Room/Greenbox is the mechanism; Sentient-Teleopity is the property; intergenerational operation of RECURVE is how the mechanism produces the property. **The Infomediary is upstream of this commitment** — round-trip integrity is what RECURVE-at-generational-scale preserves; without Infomediary integrity at the round-trip layer, RECURVE has nothing to preserve at the generational layer.

Downstream relationship clarified. The Infomediary mediates round-trips; the Waiting Room/Greenbox gates round-trip authorization through trinity conjunction; SECUIR (per §VII.4) operationalizes the GERP-tier macro-sustainability commitment at industry-scale. The

Greenbox/Waiting Room is **not** downstream of the Infomediary as a separate pending subsystem — it is the **upstream gate** to the Infomediary's pre-qualification model (per Pass C §VI.1). The architectural relationships in correct order:

The Greenbox/Waiting Room is operationally upstream of the Infomediary at every round-trip; it operates at generational scale through its RECURVE lens to produce Sentient-Teleopity as a property of accumulated round-trips, not as a separate subsystem.

§VII.4 SECUIR — The Pending Architecture for 72 Industries × Sustainability

Per BEE Pole Assignment Lock, **SECUIR is the GERP piece** — pending architecture, forward commitment.

SECUIR's scope:

- Unifies Supply Chains for **72 Industries** (canonical CyberRAVE 72 Key Domains gematric isomorphism — JAS gematria; constraint-based culling that produced exactly 72 in CyberRAVE produces exactly 72 industries in SECUIR)
- Operates rating substrate (CyberRAVE) at industry-tier rather than Civigen-tier
- Creates Sustainability through deployment-scale spectrum: **GSSG • FDRV • HFVN • THOW**

- Integrates Gunnysack (yielded-service guarantee) and SaleBuilders (deliverable-architecture)
- Operationalizes Global Economic Reform Proposal at macro-tier
- *SCALULAR is how SECUIR's commitments operate* — economies of scale, force multiplication control, La Grange Point ratification across 72 industries' clear User-GROUPS

Downstream relationship to the Infomediary. Infomediary operates at User-GROUP tier (Civigen, Institution, Investor entry surfaces). SECUIR operates at industry-tier and macro-economic-tier. SECUIR's commitments are *macro-scale* expressions of what Infomediary's commitments are *user-group-scale* expressions of. Coherence depends on both scales' commitments being expressions of the same underlying purpose-state (BEE).

Forward integration commitment. When SECUIR is specified, the Infomediary's selection-profile architecture admits industry-tier and macro-economic-tier selections as additional entry surfaces. The matrix's twelve cells gain industry-tier and macro-tier interpretations; Trilogy's filter passes run at those scales; BEE-NEXUS gains macro-tier expression alongside human-level expression. The Infomediary book is **forward-compatible with SECUIR** by architectural design.

§VII.5 The Architecture's Claim to Thousand-Year Persistence (Synthesis)

Part VII closes with synthesis. The architecture's claim to thousand-year persistence rests on five supporting commitments:

1. **Every failure mode is diagnosable and remediable.** No failure operates silently or unrecoverably. The consolidated catalog (§VII.1) names them; Pass D specifies diagnostics and remedies.
2. **VEILED is honest as a four-member state-family.** Nothing silently rejected, nothing silently passed. Honesty at state level enables recovery at operational level.
3. **Generational integrity is operational now through Waiting Room/Greenbox RECURVE at intergenerational scale.** Round-trip integrity, accumulated across generations, produces Sentient-Teleopity as a property of the existing Waiting Room/Greenbox architecture, not a separate pending subsystem. The Infomediary is upstream-coherent: round-trip integrity is what RECURVE-at-generational-scale preserves.
4. **Macro-scale integrity is forward-committed (SECUIR).** User-group-scale commitments extend cleanly to macro-scale when SECUIR is specified. SECUIR remains genuinely pending architecture; the Greenbox/Waiting Room correction (§VII.3) does not change SECUIR's pending status.
5. **Equilibrium-position recognition is operational (SCALULAR ratifies Resonance Passes at La Grange Points).** Authorization is bounded as Authorized-in-context; no authorization operates outside its context. SCALULAR's three operational functions (economies of scale,

force multiplication control, La Grange ratification) ensure the architecture's commitments scale, propagate sovereignly, and find equilibrium.

The five commitments together are what the architecture means by "thousand-year persistence." Persistence is not stasis; it is **recoverable coherence across time and scale, with authorization always bounded by context, and with generational propagation already mechanically available through the existing Waiting Room/Greenbox architecture.**

This is the Infomediary's contribution: the IOF (Instrument-of-Faith) through which round-trip integrity is operationalized across three registers (Biological/Socio/Technical, me/myself/i-I-<eye>); on which the Waiting Room/Greenbox's RECURVE lens depends at generational scale and SECUIR depends macro-economically; through which the User-GROUP's pre-qualified selections (Waiting-Room-vetted, trinity-conjoined) become binding architectural acts; and within which Resonance Passes (Authorized-in-context at SCALULAR-ratified La Grange Points) constitute the canonical unit of architectural authorization.

Pass C Closure

Part V, Part VI, and Part VII are draft. Pass C does not advance to FINAL until:

- The Hand/Head correction (Citizen/Civigen) is propagated through Pass B Chapter 5 §5.2, §5.6, and Part III §7.7.
- The IOF Trinity i/I/<eye> glyph trinity, with $i \leftrightarrow \text{SELF} / I \leftrightarrow \text{\$SELF}$ pairing and <eye>=TEACH-TECH expansion, is propagated through Pass A FINAL §0.1, §0.2, §0.7, §0.10.
- The TE(A)CH structural identity (Twin Messiah operational signature) is reviewed for covenant-tier treatment in Pass D Part VIII.
- The SCALULAR class members are enumerated in full for Pass D Glossary.
- The Primary-Source Structural-Role Assignment (UBIMIA=ROOT, Infomediary=PROXY, Trinity=DELIVERY, PlayNAC=EP×GERP×SOMT) is cross-referenced where each source is named throughout the book.
- The Resonance Pass = Authorized-in-context substitution is propagated wherever round-trip authorization is described.
- The VEILED state-family (now four members: VEILED-A, -S, -T, -L) is reviewed for completeness.
- MIEVM convergent review is run on consolidated Pass A FINAL v1.2 + Pass B Draft + Pass C Draft v1.6.

Pass D targets:

- **Part VIII** — Governance, Versioning, Covenant. The architecture's account of how it governs itself, versions itself, and binds itself to covenants — including the TE(A)CH covenant-tier Twin Messiah signature.
 - **Back Matter** — Glossary (with full SCALULAR class enumeration), References, Slot Reservations, License (CCAL v2.1), MIEVM Synthesis Note, Index.
 - **v2.0 Integration Sweep** — merging all four passes into single canonical Volume Zero. Hand/Head correction propagates throughout; IOF Trinity strategic landing throughout; SCALULAR class operational language throughout; Primary-Source Structural-Role Assignment as canonical orienting frame; Resonance Pass = Authorized-in-context as canonical authorization unit. Pass-A §1.1 representative query may finally be substituted with authentic JAS-authored query (Option α retained through all passes).
