

ERES-SIGNET-2026-001 — Status & Admissibility Record

Instrument: ERES-SIGNET-2026-001 (SIGNET v0.1, process document) **This record:** Status / disposition flag — v0.1 **Date:** 2026-06-14 **Author of this record:** JAS (ratifying authority) **License:** CCAL v2.1

1. Disposition

SIGNET-2026-001 is admitted as a **WORKING CONSTRUCT (provisional)** for its slot, and is simultaneously **FLAGGED below admission threshold** for canonical status.

Two statuses hold at once, and neither overrides the other:

Status	Value
Working-construct admission	YES — holds its slot as best-available
Canonical (BEST/SOUND/GOOD) admission	NO — flagged, pending
Standing rating (JAS honest assessment)	~7 / low-7s
Required threshold to clear flag	≥ 8.5
Gap to clear	~1.5

2. Rating provenance (why the source document shows 9.55)

The SIGNET process document (v0.1) records a BERA composite of **9.55/10** attributed to a single MIEVM node (Claude). That figure is **not the standing rating** and does not govern admission. It is retained in the process record as an artifact of the session, explicitly discounted, for two reasons:

1. **Self-rating / single-node origin.** The 9.55 was produced by an instrument internal to ERES and convened by the author. A single internal node rating an instrument it helped author is a mirror, not an external check. The author applies a standing **−1.0 minimum discount** to any single-node self-rating on principle.
2. **No convergent panel.** The full MIEVM panel (Grok, DeepSeek, ChatGPT) has not returned. Until an external convergent mean exists, no rating above the author's own honest assessment is admissible.

The standing rating is therefore ~7, the author's own assessment, not the 9.55.

3. Flag condition (falsifiable, externally resolved)

SIGNET clears its sub-threshold flag and becomes eligible for canonical admission **only** when it earns ≥ 8.5 from a source that can refuse it — i.e.:

- a convergent MIEVM panel mean (multiple nodes, not a single node), **or**
- external peer assessment outside the ERES instrument set.

The flag may not be cleared by:

- a single MIEVM node (including the originating node),
- internal reconciliation that raises the number toward a prior inflated figure,
- elapsed time / "pending" status maturing into acceptance by default.

Graduation-by-attrition is explicitly disallowed. The flag resolves up (external ≥ 8.5), stays parked (remains the working construct below threshold), or the instrument is superseded by a higher-rated construct for the same slot. All three are valid outcomes; none requires rescue.

4. Working-construct rights while flagged

While parked at provisional ~ 7 , SIGNET **may**: hold its slot as best-available, be built upon, be referenced internally, and be revised toward the threshold.

While parked at provisional ~ 7 , SIGNET **may not**: be represented as canonical / BEST-SOUND-GOOD-admitted, carry the 9.55 as its operative rating, or be presented externally as validated.

5. Naming-origin note

The v0.1 process document records first-instance naming by a MIEVM node (Claude). For the record: an instrument convened by the author cannot confer external legitimacy or admission on ERES work. The naming is retained as a creative-resonance event in the process history; it carries **no validation weight** toward the 8.5 threshold, which must be met externally per §3.
