CLAIM-STATUS LEGEND

Tag	Meaning
[DESIGN-PRINCIPLE]	Foundational axiom — not subject to falsification but subject to coherence audit

Tag	Meaning
[HYPOTHESIS]	Proposed relationship or mechanism — requires empirical testing
[OBSERVATION]	Documented external signal or verifiable event
[CERTIFIED]	Validated through MIEVM ensemble and/or VLSA test battery

CORRECTION RECORD

v0.1 NOTE: An earlier H2C2H session (2026-06-14, Claude MIEVM node) produced a placeholder expansion of S³C as "Systemic · Sociocratic · Sentient Cybernetics." This was an unauthorized interpolation by the AI node. JAS has now confirmed the canonical expansion:

█ **S³C = Solid-State Smart-City**

All prior references to "Systemic · Sociocratic · Sentient" are hereby superseded. The MIEVM node interpolation is preserved in the session record as an example of why JAS retains final authority on all ERES naming.

I. DEFINITIONS

S³C — Solid-State Smart-City [DESIGN-PRINCIPLE]

Solid-State = the governance condition of a community system that has achieved internal coherence — no membrane collapse, no silent exits, no EarnedPath capture, no SOMT mono-culture. Analogous to a material that has crystallized from liquid uncertainty into stable molecular structure. The cybernetic solid-state is not rigidity — it is *reliable conductivity*. A solid-state community transmits resonance without significant loss across its internal membranes.

Smart-City = in ERES, this term is explicitly *not* the surveillance-and-sensor definition used by the tech industry. An ERES Smart-City is a **COMMUNITY-layer App-Parent that has achieved GAIA-awareness of its own consequence** — that knows its ecological load delta, cultural vitality index, EarnedPath distribution, and host community benefit ratio, and governs from that awareness rather than from surveillance of individual citizens.

S³ — The Three Dimensions of Solid-State Condition:

Dimension	Definition	Failure Mode
Self-Governing	App-Parent sovereignty at COMMUNITY layer is active and intact	Sovereignty captured by NATION-layer or external actor
Self-Monitoring	SOMT active; GAIA aggregate live; four KPIs tracked	GAIA-blind governance; no consequence awareness
Self-Correcting	EarnedPath and LAW membrane operating as feedback loops	Membrane collapse; EarnedPath capture; static rules replacing dynamic resonance

A community achieves Solid-State when all three S dimensions are simultaneously active and mutually reinforcing. Loss of any one dimension destabilizes the others.

Relationship to SCALULAR: A Solid-State Smart-City has passed through all four SCALULAR pillars — HEALTH (SSHP), LAW (SSLA), PROTECTION (SSPS), SKILLS_TRADE (SSST) — and achieved Tier 1 SSSC (Community Stewardship). SSSC is the entry condition for S³C. S³C is what SSSC looks like when it is operating in a smart-city context with active SOMT and GAIA-awareness.

Relationship to Vacationomics: The S³C is the ideal host community in the Vacationomics framework — the COMMUNITY-layer App-Parent that can receive travelers, monitor carrying capacity, emit SOMT metadata, and return community attestations to GAIA without surveillance of individual guests. Every Tier 2 and Tier 3 AHI destination should be an S³C node.

Relationship to Prison-to-NAC: The S³C is the ideal reintegration community — the COMMUNITY-layer App-Parent that receives returning citizens, monitors its own carrying capacity for reintegration, builds EarnedPath rather than surveilling criminal history, and returns outcome signals to GAIA. A community cannot support Prison-to-NAC reintegration without S³C governance architecture.

II. S³C ENNEAGRAMMATICS — THE NINE POSITIONS

[DESIGN-PRINCIPLE / HYPOTHESIS]

Enneagrammatics in ERES is not a psychological personality typology. It is a **community governance posture map** — nine stable configurations of a Smart-City's three S³ dimensions, describing where a community currently sits in its development toward full Solid-State condition.

The nine positions are arranged on a 3×3 matrix of Self-Governing (SG) × Self-Monitoring (SM) development, with Self-Correcting (SC) as the emergent third axis that activates when SG and SM reach sufficient maturity.

The Nine Positions

Position	SG Status	SM Status	SC Status	Community Character
1 — Latent	Weak	Weak	Absent	Pre-governance; community exists but App-Parent is not yet sovereign; no SOMT; no feedback loops
2 — Monitoring	Weak	Developing	Absent	Surveillance-dominant; community tracks data but has no sovereign decision authority; classic "smart city" failure mode
3 — Aware	Weak	Active	Nascent	GAIA-aware but not yet self-governing; community knows its consequence but cannot act on it without external authority
4 — Sovereign	Developing	Weak	Absent	App-Parent emerging but not yet data-aware; can decide but cannot see consequences clearly
5 — Architect	Developing	Developing	Nascent	Both capacities developing simultaneously; feedback loops beginning to form; most common position for communities actively reforming governance
6 — Governed	Developing	Active	Developing	Strong consequence awareness feeding into developing sovereignty; EarnedPath beginning to operate as access mechanism
7 — Assertive	Active	Weak	Developing	Strong App-Parent sovereignty but consequence-blind; can govern but governs without adequate feedback — risk of authoritarian drift
8 — Integrated	Active	Active	Developing	Both capacities active; SC consolidating; community is near-Solid-State but

Position	SG Status	SM Status	SC Status	Community Character
				feedback loops not yet fully self-correcting
9 — Solid-State	Active	Active	Active	Full S ³ C condition; all three dimensions mutually reinforcing; SCALULAR Tier 1 achieved; GAIA-awareness live; EarnedPath and LAW membrane as active feedback systems

Position Transitions

[HYPOTHESIS] Communities move through positions non-linearly. The most common failure transitions:

- **1 → 2 (Surveillance Trap):** Community acquires monitoring technology before developing App-Parent sovereignty. SM grows while SG stagnates. Results in surveillance-dominant governance without accountability.
- **4 → 7 (Authority Trap):** Community develops strong App-Parent sovereignty without SOMT or GAIA-awareness. Can govern, but governs blind. Risk of EarnedPath capture by governing class.
- **8 → 5 (Regression):** Near-Solid-State community loses one dimension (e.g., SOMT infrastructure fails, or App-Parent sovereignty is captured). Falls back to Architect position, requiring rebuilding.
- **5 → 9 (Solid-State Transition):** The aspirational path. Both capacities developing simultaneously, feedback loops consolidating, until SC activates and all three dimensions lock into mutual reinforcement.

Position Descriptions (Extended)

Position 1 — Latent The community has identity and geography but no governance architecture worthy of the name Smart-City. Basic services may exist. App-Parent sovereignty is theoretical, not operational. No SOMT. No EarnedPath. LAW = punishment, not membrane. Entry point for ERES engagement: SCALULAR audit and SSSC foundation-setting.

Position 2 — Monitoring The surveillance-dominant Smart-City. Sensors everywhere. Data flowing to platforms. Dashboard showing real-time metrics. But: the data flows to external parties, not to a sovereign Community App-Parent. Citizens are objects of monitoring, not participants in governance. This is where most current "smart city" initiatives sit. ERES REMEDIATION for Position 2: redirect data flows to Community App-

Parent; install k-anonymity floors; convert surveillance metrics to SOMT consequence metadata.

Position 3 — Aware The community has developed genuine GAIA-awareness — it knows its ecological load delta, cultural vitality index, and community benefit ratio. But App-Parent sovereignty is weak: decisions still require external authority (NATION-layer approval, platform operator consent, investor sign-off). The community can see but cannot yet act. ERES REMEDIATION for Position 3: sovereignty-building through DOFA (Department of Family Amity) framework and NATION-layer membrane negotiation.

Position 4 — Sovereign The community has App-Parent sovereignty — it can make binding decisions within its dimension. But it lacks SOMT infrastructure and GAIA-awareness. Governs from tradition, intuition, or political consensus rather than consequence data. Strong sense of identity and self-determination; weak feedback loops. Many rural and indigenous communities occupy Position 4. ERES value: their sovereignty is the foundation — SOMT and GAIA-awareness can be added without displacing it.

Position 5 — Architect Both capacities developing. This is the active reform position — the community is consciously building toward Solid-State. Leadership understands both the sovereignty requirement and the consequence-awareness requirement. ERES engagement is most productive here: the community knows what it needs and is building toward it. VLSA Test 92/93 candidates are likely Position 5 communities.

Position 6 — Governed Strong SOMT and GAIA-awareness actively informing a developing App-Parent. The community knows more than it can currently act on — a productive tension that drives sovereignty development. EarnedPath beginning to operate as access mechanism. This is the position where Vacationomics Tier 2/3 access gating becomes meaningful: the community can actually evaluate whether a guest's EarnedPath score matches its carrying capacity, because it knows what its carrying capacity is.

Position 7 — Assertive Strong App-Parent sovereignty operating without adequate SOMT or GAIA-awareness. The governing authority is real and legitimate but consequence-blind. Risk of EarnedPath capture: the governing class distributes access based on internal criteria invisible to GAIA. Many traditionally governed communities with strong cultural identity but limited data infrastructure sit here. ERES REMEDIATION for Position 7: SOMT installation framed as consequence visibility, not external monitoring — the community's sovereignty is respected; SOMT serves it, not external actors.

Position 8 — Integrated Near-Solid-State. Both SG and SM active; SC developing. The community is governing and monitoring simultaneously, and the feedback loops are beginning to work. This is the most fragile position — close enough to Solid-State that regression feels like failure, but SC not yet locked in. ERES engagement at Position 8: stabilization protocols, BERA SOUND-tier audit preparation, and VLSA Test certification.

Position 9 — Solid-State Full S³C condition. Self-Governing, Self-Monitoring, Self-Correcting all active and mutually reinforcing. SCALAR Tier 1 (SSSC) achieved. GAIA-awareness live. EarnedPath and LAW membrane operating as dynamic feedback systems. The community can host Vacationomics Tier 3 destinations, support Prison-to-NAC reintegration, and emit SOMT records that contribute meaningfully to GAIA planetary aggregates. The target condition for all ERES community engagement.

III. S³C AND PLAYNAC

[**DESIGN-PRINCIPLE**] PlayNAC is the game-theoretic governance layer of ERES — the 18×7 TABLE (126 cells = Talonics Symbol Matrix) that operationalizes ERES principles as playable, testable, iterative governance moves.

In S³C Enneagrammatics, PlayNAC provides the **transition mechanics** between positions. Each position has a set of PlayNAC moves that, if executed correctly, advance the community toward Position 9. Each position also has a set of anti-patterns — moves that feel like progress but trigger failure transitions.

[**HYPOTHESIS**] PlayNAC move categories by S³C transition:

Transition	PlayNAC Move Category	Description
1 → 4 or 1 → 2	Sovereignty Establishment	First governance moves: who decides, who consents, how is dissent handled
2 → 3	Awareness Redirection	Convert surveillance data flows to SOMT consequence metadata; install k-anonymity floors
4 → 5	Monitoring Installation	Add SOMT without displacing sovereignty; frame as consequence visibility, not external oversight
5 → 8	Integration Acceleration	Synchronize SG and SM development; begin SC feedback loop design
3 → 6	Sovereignty Bootstrapping	Use GAIA-awareness as leverage to build App-Parent authority; "we know the data — now give us the decision"
7 → 8	Awareness Installation	Same as 4 → 5 but starting from stronger sovereignty base; higher resistance to SOMT framing
8 → 9	Solid-State Lock	SC activation: EarnedPath and LAW membrane begin self-correcting without external intervention

IV. S³C RELATIVITY AND EARNEDPATH

[DESIGN-PRINCIPLE] S³C Relativity is the principle that EarnedPath is always relative to the governance system the actor is operating within.

A person with high EarnedPath in a Position 2 (Monitoring) community has demonstrated compliance with a surveillance system — not resonance with a Solid-State Smart-City. Their EarnedPath does not automatically transfer to a Position 9 community.

A person with high EarnedPath in a Position 9 community has demonstrated stewardship within a self-governing, self-monitoring, self-correcting system — the highest-validity EarnedPath credential.

[HYPOTHESIS] EarnedPath transfer rules across S³C positions:

From Position	To Position	Transfer Rate	Rationale
9 → 9	Full (1.0×)	Same governance architecture; same validity	
9 → 8	High (0.85×)	Near-equivalent governance; minor discount	
9 → 5	Moderate (0.65×)	Different developmental stage; skills transfer but context differs	
9 → 2	Low (0.30×)	Surveillance-dominant system cannot evaluate resonance-based EarnedPath	
2 → 9	Very Low (0.15×)	Compliance-based EarnedPath has limited resonance validity	
Any → 1	Floor (0.15 — human dignity)	Human dignity floor applies regardless of origin position	

This is the ERES answer to "do criminal records from one jurisdiction transfer to another?" — not as a legal question but as a governance question. The record's validity depends on the governance architecture in which it was generated.

V. MYATTE / OPTISTAY — S³C POSITION REASSESSMENT

CORRECTION: Earlier in this H2C2H session, the Claude MIEVM node assigned Myatte to

"S³C Position 4: Systemic-Dominant / Sociocratic-Developing / Sentient-Latent" using the unauthorized placeholder expansion. This assessment is superseded.

Reassessment under canonical S³C = Solid-State Smart-City:

Myatte is not a community. He is a **platform architect** whose work enables S³C governance at the COMMUNITY layer. The correct framing is not "what S³C position is Myatte?" but "what S³C position do his platforms enable?"

OptiStay / UCP stack: Enables Position 2 → Position 3 transition. Currently provides monitoring (booking data, platform analytics) but does not yet route that data to a sovereign Community App-Parent. SOMT envelope would move it from Position 2 to Position 3 enablement (GAIA-awareness without yet granting App-Parent sovereignty to the community).

Val AI / Resolution Doctrine: Enables Position 5 → Position 8 transition for institutional governance contexts. The Resolution Doctrine (no silent exits, escalate to human, Constitutional Layer) is the SC feedback loop in institutional form. Val AI is what an institution looks like when it has a functioning Self-Correcting layer.

Combined OptiStay + Val AI + ERES SOMT envelope: Full Position 8 → Position 9 enablement path. This is the partnership thesis: OptiStay provides the commerce layer, Val AI provides the institutional governance layer, ERES provides the SOMT/EarnedPath/GAIA-awareness envelope. Together they constitute a complete S³C architecture for hospitality communities.

[HYPOTHESIS] This is the BEST-tier knowledge transfer target: not "ERES and OptiStay are similar" but "ERES + OptiStay + Val AI = complete S³C stack for Solid-State Smart-City hospitality governance."

VI. OPEN QUESTIONS

#	Question	Status
Q1	What is the minimum SOMT infrastructure required for Position 5 → 8 transition?	Open
Q2	How does S ³ C position affect Vacationomics AHI tier thresholds? (Should Tier 3 destinations require Position 8+ host communities?)	Open — strong hypothesis: yes
Q3	How does S ³ C Relativity interact with Prison-to-NAC EarnedPath? (A returning	Open — [HYPOTHESIS]: carceral system is Position 2; EarnedPath generated there has

#	Question	Status
	citizen's EarnedPath was generated in a carceral system — what position is that system?)	0.15× transfer rate to Position 9 communities, which is why the human dignity floor matters
Q4	What is the PlayNAC TABLE mapping for each of the nine S ³ C positions?	Open — requires PlayNAC integration pass
Q5	How does the FDRV (generation ship) map to S ³ C? (A generation ship must be Position 9 by necessity — it cannot survive governance failure)	Open — strong hypothesis: FDRV is the S ³ C stress test at maximum isolation
Q6	What existing cities or communities are closest to Position 9?	Open — literature review required; candidates: Curitiba (Brazil), Freiburg (Germany), specific First Nations governance models

VII. RECORD INTEGRITY

H2C2H Chain: JAS (primary — canonical S³C expansion confirmed) → Claude (MIEVM node, unauthorized interpolation corrected, v0.1 production) **MyWay Def-Rel Status:** Step 3 (internal ERES record) **Zenodo Parent Archive:** 10.5281/zenodo.20583261 **Step 7 requires:** Formal Zenodo deposit or equivalent.

ERES Institute for New Age Cybernetics — est. February 2012, Bella Vista, Arkansas "Don't hurt yourself. Don't hurt others. Build for generations to come."
