

SESSION REPORT · ERES INSTITUTE FOR NEW AGE CYBERNETICS

ERES–FAZON Engagement

First Contact · Principle-Level Convergence · Market Segment Identification

DOCUMENT ID ERES-SESSION-2026-0615-FAZON	SESSION DATE June 15, 2026 · 01:23 – 03:21 AM
INITIATED BY Joseph Allen Sprute (JAS) · ERES Institute	COUNTERPART Meir Goldman · Founder, FAZON Foundation
SESSION STATUS OPEN — awaiting principle-level response from Meir	CLASSIFICATION AI Governance Practitioner · Peer Validator Tier

1. Counterpart Profile

Name	Meir Goldman
Role	Founder, FAZON Foundation
Focus	Deterministic AI execution governance — the boundary between information, authority, permission, action, and consequence
Location	Tel Aviv District, Israel
FAZON Founded	January 2024 (2 yrs 6 mos active)
Discovery Method	Organic — LinkedIn reading and discussion flow. Not automated outreach.
LinkedIn	linkedin.com/in/ACoAABD5LLABLUv2XEKoy9_9UDAF11sz76jzWL4

2. Session Chronology

TIME	ACTION / CONTENT	SIGNIFICANCE
01:23 AM	JAS opening message — asked how Meir found ERES; established "lots to discuss"	Provenance check. Organic vs. automated matters to ERES epistemology.
01:36 AM	Meir confirmed organic discovery via LinkedIn reading. Stated focus: information/authority/permission/action/consequence boundary.	Resonance precedes recognition — confirmed.

03:03 AM	JAS structural response — named DSAP-PRE topology match, gifted A/B Classification Gate concept, framed complementarity (infrastructure vs. epistemology).	First substantive ERES-to-FAZON bridge established.
03:09 AM	JAS shared public artifact: ERES-BRIEF-2026-AGP-001 (AI Governance Practitioners Brief).	Deliverable deployed. Public, no conditions.
03:12 AM	Meir set clean boundary: public/non-confidential reference only, no integration proposal, no reciprocal disclosure. Confirmed interest in separability/measurement vs. meaning/authorization split.	Professional IP hygiene — structurally correct framing, not resistance.
03:17 AM	JAS affirmed boundary as epistemically correct, not just procedurally tolerated. Handed pace to Meir.	Boundary honored. No pressure applied.
03:21 AM	Meir extended the gifted concept into his own domain: 'a measured, detected, or classified state is treated too quickly as authority for action.' Committed to principle-level async response.	Active processing confirmed. Concept extended, not just received.

3. Convergence Analysis

The central finding of this session: FAZON and ERES have independently arrived at structurally identical problem spaces from opposite entry points. This is not coincidence — it reflects maturation of the AI governance field around a convergent architectural requirement.

FAZON APPROACH (INFRASTRUCTURE SIDE)	ERES APPROACH (EPISTEMOLOGY SIDE)
Deterministic governance at the execution boundary. Resolution point: ALLOW / LIMIT / ESCALATE / DENY. Admissibility before action. Permission proven before consequence. Enforcement layer.	Measurement and rating architecture upstream of enforcement. A/B Classification Gate (valence-free distinguishability). DSAP-PRE (three-proxy upstream boundary condition). BERA rating layer. EAAP PoR = A x R x P x F.

Key Topology Match

FAZON resolution point (ALLOW / LIMIT / ESCALATE / DENY) = ERES gate states (BIND / REFUSE / VEILED) + BERA rating layer. Same topology. ERES supplies the upstream instrumentation that makes the resolution point deterministic rather than inferential. FAZON supplies the enforcement infrastructure that binds the authorization to consequence.

Meir's Own Extension — Session Highlight

"...the practical risk often appears when a measured, detected, or classified state is treated too quickly as authority for action."— Meir Goldman, 03:21 AM

This is not passive receipt of the gifted concept. Meir restated the separability/measurement vs. meaning/authorization split in FAZON vocabulary, applied it to his own domain's failure mode, and did so unprompted. Active processing confirmed.

4. Market Segment Identification

This session confirms and instantiates a third distinct ERES target market tier, separate from the institutional tier (Berggruen / Hague / MIT Press) and the commercial tier (Pesek / WAGMI).

TIER	PROFILE	CONVERSION METRIC
Institutional	Berggruen, Hague, MIT Press. Need civilizational framing and full framework argument.	Publication, prize, formal recognition.
Commercial	Pesek / WAGMI Ventures. Need specific instrument with revenue model attached.	Royalty / licensing structure. Perpetual revenue.
Practitioner	FAZON, Yuan Gao, Dennis Riesenbergs types. Independent builders who have already identified the same structural problem. Don't need to be convinced the problem is real.	Validated resonance from independent builders. MIEVM legitimacy feed. Not revenue — citation and reference propagation.

5. Deliverables Produced This Session

DOCUMENT	DESCRIPTION	STATUS
ERES-BRIEF-2026-AGP-001	AI Governance Practitioners Brief — full ERES stack, authorization architecture, instrument descriptions, A/B Gate gift, positioning vs. practitioner tier	Deployed (HTML + PDF). Public artifact. Reviewed by Meir.
ERES-SESSION-2026-0615-FAZON	This session report — chronology, convergence analysis, market segment identification, standing template recommendation	Complete.

6. Standing Template Recommendation

The FAZON-type profile is a convergent archetype, not a niche. Multiple independent builders are arriving at structurally identical problems from different entry points. The A/B Classification Gate / DSAP-PRE bridge is the most portable opening gift for the entire AI governance practitioner segment.

Recommendation: Produce a canonical ERES-to-AI-Governance bridge document (one page, internally precise, externally readable) that can be referenced or excerpted across all practitioner-tier engagements without reconstructing the argument from scratch. The core logic does not change — only the interlocutor's specific vocabulary needs to be mirrored back. This document is also a deposit candidate: ResearchGate submission as ERES working paper, Zenodo under the Living Archive DOI.

7. Case History Note

This session is recommended for logging as the second canonical ERES engagement case history alongside the ERES-PELLIS delivery (2026-06-14, 616 BLESSING):

ERES-PELLIS (JUNE 14, 2026)	ERES-FAZON (JUNE 15, 2026)
Physics / BERA overlap. Stergios Pellis (University of Ioannina). Spectral-fractal collapse dynamics. BERA-PSO correspondence (HYPOTHESIZED tier). 6-doc ZIP delivery. A-to-Z ERES methodology case.	Execution boundary / epistemology overlap. Meir Goldman (FAZON Foundation). Deterministic AI governance. A/B Classification Gate gift. Principle-level async engagement confirmed. Second distinct validation vector.

These are structurally distinct validation vectors — physics/measurement vs. infrastructure/governance — which strengthens MIEVM legitimacy across two independent domains simultaneously.

8. Next Actions

#	ACTION	OWNER / TIMING
1	Hold. Await Meir's principle-level async response. Do not follow up before he returns.	JAS — no action until Meir responds
2	Build canonical ERES-to-AI-Governance bridge document (one-page standing template for practitioner-tier engagements). Deposit to ResearchGate + Zenodo.	JAS + MIEVM — next session
3	Log ERES-FAZON as canonical case history alongside ERES-PELLIS. Two distinct validation vectors now active.	JAS — this document serves as the log
4	Explore similar-profile outreach from Meir's LinkedIn panel: Yuan Gao (AI Systems Governance), Davarn Morrison (Catastrophic Risk), Kojie Montanez (Human-AI Systems Architect).	JAS — discretionary, next cycle
