Released under CARE Commons Attribution License v2.1 (CCAL v2.1)

For institutional review and prospective-licensee evaluation

Executive Summary

This whitepaper presents the licensing framework for the ERES Institute for New Age Cybernetics, an independent research organization established in February 2012 by Joseph Allen Sprute and Dalia Sprute, Co-Founders. The framework organizes the ERES architecture into a six-element structure: one upstream protocol (IDIPITIS, the intent-declaration discipline), five licensable function-vessel pairs, and one App-Parent (SCALULAR delivered through SaleBuilders) that carries the entire commercial substrate. All six elements operate under the ERES Umbrella and rest upon an open-source foundation released under CCAL v2.1.

The licensing proposition in one sentence

ERES licenses five governance, mediation, rating, and fulfillment products — each delivered through its native operational vessel, all carried on the SCALULAR App-Parent, all initiated by IDIPITIS-declared intent, all resting on an open-source substrate that customers can verify.

The Six-Element Architecture

Upstream protocol — IDIPITIS. The intent-declaration discipline that initiates every ERES exchange. Not licensed; a universal precondition.

- 1. PlayNAC, delivered through VERTECA.** Game-theoretic governance overlay with embedded attestation; includes EarnedPath, GERP, and SOMT modules.
- 2. Infomediary, delivered through SECUIR.** Trusted-broker mediation of cross-party information flow; includes THOW, HFVN, FDRV, and GSSG modules.
- 3. HowWay, delivered through CyberRAVE.** Industry rating and method-as-path certification against the open 72 Industry Rating Matrices, with RT_Lookup query interface.
- 4. SLA-Fulfillment, delivered through Gunnysack.** IDIPITIS-aware bundled-certified-service fulfillment with COI (Community of Interest) attestation.
- 5. SCALULAR, delivered through SaleBuilders.** The Intelligent-Design App-Parent on which all four other offerings run. Houses User-GROUP Cause-Effect / Action-Reaction logic and ERES EPIR-Q. Scalable Certification Architecture for Lifelong Universal Learning and Adaptive Resilience.

Foundation and Differentiation

ERES rests on a substrate released open-source under the CARE Commons Attribution License v2.1 (CCAL v2.1), MIT-compatible for code components. The substrate includes the Talonics cryptographic stack primitive (v1.3, 452 elements, 126 governance states, the VEILED hold-state) and the CyberRAVE 72 Industry Rating Matrices. The substrate is freely available for any party to inspect, adopt, and extend. The licensable tiers above sit atop this open foundation, creating customer trust (the substrate is auditable), regulatory durability (the substrate cannot be revoked), and commercial defensibility (the application tiers carry ERES expertise that the substrate alone does not supply).

Engagement Model

The ERES Institute operates under disability-aware founder engagement constraints. Founder engagement is structured at a baseline of advisory hours per month, with phased expansion reserved for post-business-registration deployment. Implementation and operations are designed to be executable by licensee teams or designated third parties, with ERES Founders providing oversight, attestation review, and standards interpretation.

Legal Standing

The ERES Institute operates under an internal Founders' Agreement between Joseph Allen Sprute and Dalia Sprute, reflecting equal Co-Founder standing. Formal legal restructure is proceeding through municipal business registration in Bella Vista, Arkansas. Intellectual priority for ERES constitutional proposals was established through the March 2026 Hague filing (ERES-HAGUE-2026-001).

1. The ERES Umbrella

1.1 Institutional Identity

The ERES Institute for New Age Cybernetics is an independent research and development organization headquartered in Bella Vista, Arkansas. The Institute was established in February 2012 by Joseph Allen Sprute (ERES Maestro), with Dalia Sprute as Co-Founder under the Institute's internal Founders' Agreement. The Institute has produced more than 430 publications on ResearchGate since its founding and operates under ORCID 0000-0001-9946-3221.

The acronym ERES expands to Empirical Realtime Education System. The expansion is operative rather than decorative: the Institute's deliverables are designed to deliver empirical, real-time, education-tier improvements in how organizations and societies make decisions under uncertainty.

1.2 Co-Founder Standing

Joseph Allen Sprute and Dalia Sprute are Co-Founders of the ERES Institute, operating under an internal Founders' Agreement reflecting equal Co-Founder standing. The Founders maintain a unified household and have built the ERES corpus together since 2012, with Dalia's role as personal anchor and structural Co-Founder reflected throughout the Institute's architecture, including in the DAL hinge of the Twin Messiah construct and in the equity provisions of the ERES Equity Covenant (ERES-COVENANT-2026-001).

Formal legal restructure to reflect equal Co-Founder ownership is proceeding through municipal business registration in Bella Vista, Arkansas. Prospective licensees should expect signature and counter-signature from both Founders on binding instruments.

1.3 Founder Background

Joseph Allen Sprute is a United States Army veteran, having served in the Oregon Army National Guard (1983–1989) as Infantry (11B), with Honorable Discharge. He has been developing the ERES framework continuously since the CyberRAVE / Global_VPN era of the mid-1990s, through the SaleBuilders period (1997–2012), and through the ERES Institute period (2012–present).

Dalia Sprute is the structural and personal anchor of the ERES Institute. Her role spans the institutional, fiduciary, and constitutive layers of the architecture.

2. The Six-Element Architecture

The ERES Umbrella organizes intellectual property and service offerings into six distinct architectural elements. These are summarized in the table below and detailed in Sections 3 through 8.

Element	Function	Vessel	Role
Upstream Protocol	IDIPITIS	(protocol)	Intent-declaration discipline. Universal precondition. Not licensed.
Licensed Offering 1	PlayNAC	VERTECA	Game-theoretic governance overlay. Contains EarnedPath, GERP, SOMT.
Licensed Offering 2	Infomediary	SECUIR	Trusted-broker mediation. Contains THOW, HFVN, FDRV, GSSG.
Licensed Offering 3	HowWay	CyberRAVE	Industry rating against 72 IRI Matrices with RT_Lookup.
Licensed Offering 4	SLA-Fulfillment	Gunnysack	IDIPITIS-aware bundled-certified-service fulfillment with COI attestation.

Element	Function	Vessel	Role
App-Parent	SCALULAR	SaleBuilders	Intelligent-Design App-Parent. Carries all four offerings. Houses User-GROUP Cause-Effect / Action-Reaction logic and ERES EPIR-Q.

2.1 How the Elements Relate

Every ERES engagement begins with IDIPITIS — the act of declaring intent before action. Once intent is declared, the engagement is routed through one or more of the four licensed offerings (PlayNAC, Infomediary, HowWay, SLA-Fulfillment), each delivered through its native vessel. All four offerings execute on the SCALULAR App-Parent, delivered through SaleBuilders, which provides the transactional substrate, the cause-effect logic, and the structural CARE-compliance discipline that allows ERES to make and keep service-level commitments.

This structure means a customer engaging any single ERES offering also receives the implicit benefit of the App-Parent's discipline (CARE-compliant transaction substrate, SLA enforcement, attestation routing) and the upstream protocol (intent-declaration with audit trail). Multi-offering engagements compound this benefit because the same App-Parent carries all components.

3. Upstream Protocol — IDIPITIS

3.1 What IDIPITIS Is

IDIPITIS is the ERES intent-declaration protocol. Before any ERES action occurs — a governance decision, an information exchange, an industry rating, or a service fulfillment — IDIPITIS requires that the intent driving the action be explicitly declared, attested, and recorded. This converts what would otherwise be implicit motivation into explicit, auditable input.

3.2 Why It Sits Upstream

IDIPITIS is not a licensed offering. It is a protocol-tier discipline that operates above all four offerings and constrains how they may be invoked. Every PlayNAC decision begins with IDIPITIS-declared intent. Every Infomediary exchange begins with IDIPITIS-declared intent. Every HowWay rating engagement begins with IDIPITIS-declared intent. Every SLA-Fulfillment bundle is assembled in response to IDIPITIS-declared intent.

This upstream position means IDIPITIS does not require separate licensing. Customers engaging any ERES offering operate under IDIPITIS by default, as a precondition of engagement.

3.3 Operational Benefit to Customers

The customer-visible benefit of IDIPITIS is the audit-trail property it produces. Every ERES exchange carries a declared-intent record at its head, signed under EAAP, recoverable under EAAP-CRL revocation. This means a customer asked years later “why did your board decide X” or “why did you exchange this data with that counterparty” has a cryptographically signed answer rooted in the declared intent that initiated the exchange. This is a regulatory-defensibility property of growing market value.

4. PlayNAC, Delivered Through VERTECA

4.1 Scope

PlayNAC (the ERES game-theoretic governance overlay) is licensed to enterprise customers, standards bodies, and public agencies for use within their decision-making and governance processes. Delivery is through VERTECA, the ERES 4D voice/visual immersive environment, which provides the participant experience layer for PlayNAC sessions, deliberations, and attested decisions.

4.2 Modules Contained

- **EarnedPath (EP).** The ERES merit-tracking and contribution-attribution module. Records earned standing within a PlayNAC governance scope.
- **GERP.** The Global Economic Reform Proposal module. Provides economic-reform-framework templates for governance scopes operating at policy or systems-level scale.
- **SOMT.** Sociocratic Overlay Metadata Tapestry. Provides the metadata substrate by which sociocratic governance can be applied as an overlay across heterogeneous decision contexts.

4.3 What the Customer Receives

- A licensed PlayNAC overlay configured for the customer's governance scope (board, committee, standards body, agency).
- VERTECA environment provisioning, with customer-branded deployment options.
- Module activation for EP, GERP, and SOMT as scoped to the engagement.
- Integration with the customer's existing identity, authentication, and audit infrastructure.
- BERA-metric attestation services (ARI, ERI, RHC, RCI) for decisions made within the PlayNAC overlay.
- EAAP-signed trace-commit records under post-quantum migration commitments (ML-DSA, Falcon).
- Founder advisory hours per the engagement model in Section 9.

4.4 Indicative Pricing

Annual license: USD 50,000 to 250,000, depending on scope and active module set.
Per-attestation service fee: USD 15 to 50 per attested decision, with volume bands.
Implementation: separately scoped; typically USD 25,000 to 100,000 one-time.

4.5 Target Customers

Enterprise boards seeking governance modernization; ESG-rated public companies requiring auditable decision provenance; standards bodies (national and international); public agencies operating under transparency mandates; large nonprofits and foundations operating multi-stakeholder governance.

5. Infomediary, Delivered Through SECUIR

5.1 Scope

Infomediary services mediate information flow between counterparties under attestation, with the SECUIR (Silent Energy Circular Universe Infinite Rotation) framework providing the broker substrate. Customers use SECUIR to exchange sensitive information with counterparties under attested, auditable, and post-quantum-signed terms, without either party requiring direct access to the other's systems.

5.2 Modules Contained

- **THOW.** Tiny Homes on Wheels module. Mobility-aware exchange patterns for distributed-but-coordinated counterparties; foundational to the VLSA principle (“if it works in a THOW, it works on a generation ship”).
- **HFVN.** Cross-counterparty exchange module operating at the household / family / village / network scale.
- **FDRV.** Family Distributed Resonant Vessel module. Provides exchange patterns scaled to fleet, generation-vessel, and large-distributed-cohort contexts.
- **GSSG.** Group-scale exchange module operating under shared-stewardship governance.

Note: Module expansions for HFVN and GSSG are documented in the forthcoming *ERES Product Catalog (ERES-CATALOG-2026-001)*. Licensees engaging Infomediary services receive complete module specifications under non-disclosure as part of engagement onboarding.

5.3 What the Customer Receives

- A licensed SECUIR Infomediary instance configured for the customer's mediation scope.
- Integration kits for common counterparty patterns: vendor exchange, regulator exchange, partner exchange, cross-border exchange.
- Module activation for THOW, HFVN, FDRV, and GSSG as scoped to the engagement.

- Talonics-encoded message templates for routine exchange types.
- VEILED-state hold discipline for messages pending counterparty acknowledgment.
- RATE-signed receipts for every completed exchange, with EAAP-CRL revocation availability.
- Founder advisory hours per the engagement model in Section 9.

5.4 Indicative Pricing

Annual license: USD 25,000 to 150,000, depending on counterparty count, message volume, and active module set. Per-exchange fee: USD 5 to 25 per attested exchange, with volume bands. Custom counterparty integration: separately scoped.

5.5 Target Customers

Companies operating in regulated industries with frequent regulator exchange (financial services, healthcare, energy); cross-border operators requiring data-residency-compliant exchange; supply-chain leads requiring vendor attestation; M&A and due-diligence operators; standards bodies operating multi-party consensus processes.

6. HowWay, Delivered Through CyberRAVE

6.1 Scope

HowWay rating services certify operational method and path against the open CyberRAVE 72 Industry Rating Matrices, providing market participants with a published rating spine for operational quality, ESG compliance, equity flow, and methodological provenance. The CyberRAVE-72 IRI Matrices are released open-source; ERES licenses the certification service that maps a customer's operations to the matrices and produces attested ratings.

6.2 Components Contained

- **72 Industry Rating Matrices.** The open rating spine, released under CCAL v2.1 with CC BY-SA 4.0 for documentation. Inspectable, forkable, citable.
- **RT_Lookup.** The real-time lookup query interface against the rating matrices, enabling customers, counterparties, and regulators to validate current rating status on demand.

6.3 What the Customer Receives

- Initial assessment against the relevant subset of the 72 IRI Matrices for the customer's industry vertical.
- HowWay rating report under EAAP attestation, suitable for procurement, investor, and regulator presentation.
- RT_Lookup access for the customer and authorized third parties (counterparties, regulators, investors).

- Annual re-rating with delta analysis.
- Optional public listing on the ERES HowWay registry.
- Integration with BERA metric flow for Meritcoin accrual (where customer participates in the wider equity-flow framework).
- Founder advisory hours per the engagement model in Section 9.

6.4 Indicative Pricing

Initial rating: USD 10,000 to 75,000, depending on industry-vertical complexity and matrix subset scope. Annual re-rating: 50 to 75 percent of initial. RT_Lookup access: included with rating, with usage-based fees for third-party access at scale. Custom matrix extension for industry-specific subdomains: separately scoped.

6.5 Target Customers

ESG-rated companies seeking deeper operational attestation than current ESG ratings provide; B-Corp and similar mission-driven entities requiring operational verification; public-procurement vendors needing third-party operational rating; emerging-market companies seeking developed-market credibility; institutional investors seeking due-diligence-grade operational rating substrate.

7. SLA-Fulfillment, Delivered Through Gunnysack

7.1 Scope

SLA-Fulfillment services assemble, underwrite, and deliver bundled certified services in response to IDIPITIS-declared intent. Gunnysack is the underwriter and packager: it stands behind the certified bundle commercially, attaches the certification mark that gives buyers enforceable assurance, and operates the COI (Community of Interest) attestation that makes cross-party fulfillment durable. Where the other offerings supply individual capabilities, Gunnysack supplies the integrated, warranted, end-to-end bundle.

7.2 Components Contained

- **COI Attestation.** Community of Interest attestation surfacing the participants, stewards, and counterparties bound to a fulfilled bundle. Makes implicit relationships explicit and contractually referable.
- **SLA-Fulfillment Engine.** The mechanism by which an IDIPITIS-declared intent is parsed, decomposed into component services across PlayNAC, Infomediary, HowWay, and supporting tiers, assembled into a certified bundle, and warranted for delivery.

7.3 What the Customer Receives

- A certified bundle assembled in response to IDIPITIS-declared intent, drawing on the relevant subset of PlayNAC, Infomediary, and HowWay offerings.
- Gunnysack underwriting warranty: a single contractual point of recourse for the integrated bundle.
- COI attestation listing the Community of Interest bound to the bundle.
- Single-point renewal and amendment processes covering the full bundle.
- Founder advisory hours per the engagement model in Section 9.

7.4 Indicative Pricing

Per-bundle underwriting fee: USD 15,000 to 75,000, sized to bundle scope and component count. Annual certification maintenance: 25 to 40 percent of initial underwriting fee. Custom COI attestation depth: separately scoped.

7.5 Target Customers

Customers engaging two or more ERES offerings integrated into an end-to-end attestation regime; standards bodies requiring single-point recourse on multi-component certifications; foundations and large nonprofits operating cross-cutting governance, mediation, and rating workflows; sovereign and quasi-sovereign entities seeking integrated bundle delivery under unified warranty.

8. SCALULAR, Delivered Through SaleBuilders — The App-Parent

8.1 Scope

SCALULAR (Scalable Certification Architecture for Lifelong Universal Learning and Adaptive Resilience) is the ERES App-Parent. It is the substrate engine on which all four other licensed offerings descend, the transactional logic that allows ERES to operate commercially, and the discipline-enforcing layer that makes structural CARE-compliance non-optional rather than policy-dependent. SCALULAR is delivered through SaleBuilders, the Force-Multiplication App-Parent platform with thirty years of marketplace lineage.

8.2 Components Contained

- **User-GROUP Cause-Effect / Action-Reaction Logic.** The structural mechanism by which user and group actions produce attestable cause-effect chains. This is the engine of the Intelligent-Design discipline that animates SCALULAR.
- **ERES EPIR-Q.** The ERES query and reasoning interface to the cause-effect substrate. Enables licensees to inspect, audit, and reason about the action-reaction chains operating within their SCALULAR deployment.

- **SCALULAR Pillars.** Four certification pillars — HEALTH (SSHP), LAW (SSLA), PROTECTION (SSPS), SKILLS_TRADE (SSST) — each operating under shared Scalable Certification discipline.

8.3 Why SCALULAR Is the App-Parent

Two structural properties qualify SCALULAR as the App-Parent. First, universal underlay: every PlayNAC governance decision, every Infomediary exchange, every HowWay rating, and every Gunnysack-fulfilled bundle ultimately runs on SCALULAR transactional substrate. Without SCALULAR, the other offerings have nowhere to execute. Second, discipline-enforcing: SCALULAR's CARE-compliance constraint is structural rather than policy-imposed. The engine cannot operate outside CARE terms because that constraint is built into how it functions, not added afterward.

8.4 What the Customer Receives

SCALULAR is not typically licensed as a standalone offering for first-time customers. It is the App-Parent on which other offerings run. However, customers operating at certification-architecture scale — those seeking to deploy ERES-grade lifelong-learning, certification, and adaptive-resilience infrastructure across an entire institution or jurisdiction — may license SCALULAR directly. Such engagements receive:

- Full SCALULAR deployment across the four pillars (SSHP, SSLA, SSPS, SSST), scoped to the institution's operational scope.
- ERES EPIR-Q access for audit, reasoning, and certification-flow analysis.
- Underlying SaleBuilders platform deployment with Force-Multiplication promotion discipline.
- Integration of any combination of PlayNAC, Infomediary, HowWay, and Gunnysack offerings under the SCALULAR substrate.
- Founder advisory hours at expanded scope, with reservation for Tier B engagement upon enabling conditions.

8.5 Indicative Pricing

SCALULAR engagements are negotiated. Indicative range: USD 250,000 to 5,000,000 annual, depending on institutional scope, pillar coverage, and integration depth. These engagements are typically multi-year and may include revenue-share, equity, or covenant components negotiated under the ERES Equity Covenant.

9. Founder Engagement Model

ERES operates under a Founder engagement model designed to be compatible with the Founders' current obligations and capacities, including disability-aware engagement limits and the in-progress Bella Vista business registration.

9.1 Tier A — Advisory Baseline (current)

Under Tier A, Founder engagement is capped at a defined number of advisory hours per month per engagement, with implementation and operations handled by licensee teams or designated third parties. Founder responsibilities under Tier A include:

- Engagement kickoff and scope-definition advisory.
- Quarterly engagement review and standards-interpretation guidance.
- Attestation review for material decisions and ratings.
- Escalation handling for standards-interpretation disputes.
- Annual engagement renewal advisory.

Tier A is the default engagement level and is available for all five offerings immediately.

9.2 Tier B — Phased Expansion (reserved)

Tier B engagement is reserved for activation following formal business registration in Bella Vista and any further enabling steps. Under Tier B, Founder engagement may expand to include direct implementation participation, on-site engagement, and operational responsibilities. Tier B terms will be specified by amendment to individual licensing agreements upon activation.

9.3 Designated Third Parties

Where licensees require implementation or operational depth beyond Tier A advisory hours, ERES can designate third parties (consultants, integration partners, or licensee-internal teams) to operate under ERES standards. ERES retains attestation-review authority over designated third parties' deliverables.

10. The Open-Source Substrate

The credibility of the five licensable offerings rests on a substrate that ERES has released open-source. This is a deliberate strategic choice. By releasing the substrate openly, ERES converts customer suspicion (“are these ratings real?”) into customer verifiability (“the rating spine is published; the cryptographic primitives are auditable; we can inspect what we are buying”).

10.1 Talonics — The Cryptographic Stack Primitive

Talonics is the ERES cryptographic stack primitive (v1.3), a three-tier symbolic substrate (Symbols, Characters, Talonics) with 452 elements across 12 parts supporting 126 governance states (18 by 7). Talonics provides the symbolic foundation for the EAAP attestation protocol

and the VEILED hold-state discipline that wraps every PlayNAC, Infomediary, HowWay, and SLA-Fulfillment attestation. Talonics is released under CCAL v2.1 with MIT compatibility for code components.

10.2 CyberRAVE 72 Industry Rating Matrices

The CyberRAVE 72 Industry Rating Matrices are the open rating spine against which HowWay certifications are issued. The 72 matrices were culled, pre-1997, during the Global_VPN era, and have been refined continuously since. The matrices are released under CCAL v2.1 with CC BY-SA 4.0 for documentation. Any party may inspect the matrix definitions, propose extensions, or use them for non-commercial rating; ERES licenses the certification service that produces attested ratings against them.

10.3 The Strategic Logic

Customers buying ESG ratings, governance services, or attestation products today face a problem: the substrate is proprietary, and they must trust the vendor's claim that the substrate is meaningful. ERES inverts this. The substrate is open, inspectable, and forkable. What customers pay ERES for is not the substrate; it is the expertise that maps their organization to the substrate, the cryptographic infrastructure that attests the mapping, and the ongoing service that keeps the mapping current. This is the same logic that has built durable commercial businesses around open-source databases, open-source operating systems, and open-source language runtimes.

11. EVAÏ Integration Path

EVAÏ is a model-agnostic pre-execution decision gate released by Hiro Yokoki under the MIT License. EVAÏ provides a four-stage loop (E Intent, V Options, Ì Decision Gate, Ì Trace Commit) at the AI-inference substrate. ERES has filed a companion interoperability whitepaper (ERES-TALONICS-EVAÏ-INTEROP-2026-001) demonstrating that Talonics and EVAÏ are operationally complementary, with VEILED supplying EVAÏ's gate-hold semantics and RATE supplying its trace-commit content.

11.1 What ERES Offers to EVAÏ Adopters

Organizations that have adopted EVAÏ as their inference-gate protocol may license PlayNAC governance from ERES Infomediary services. In this configuration, EVAÏ provides the inference-gate substrate, and PlayNAC provides the governance overlay that determines what intents (E), options (V), and decisions (Ì) are permissible within the customer's policy regime. SECUIR Infomediary brokers the licensing terms and the operational integration.

This integration path is offered specifically for customers who have an existing EVAE deployment and do not need or want the VERTECA immersive environment. It is functionally equivalent in governance terms but lighter in deployment footprint.

11.2 Licensing Terms for EVAE Adopters

- PlayNAC licensing terms identical to Section 4, with VERTECA provisioning omitted.
- Integration support specifically scoped to EVAE deployment patterns.
- Attestation services routed through SECUIR Infomediary rather than VERTECA.
- Discount of typically 20 to 35 percent on annual license, reflecting the omitted VERTECA layer.

11.3 Respect for Yokoki's Work

ERES makes no claim of authorship, ownership, or co-authorship over EVAE. EVAE remains the work of Hiro Yokoki, released under the MIT License. The integration path described here is offered as a service ERES provides to EVAE adopters; it does not extend ERES rights over EVAE itself. A courtesy notification of this licensing framework will be sent to the EVAE repository maintainers in keeping with the ERES principle of faith extended first and validated by method.

12. Standards, Compliance, and Intellectual Position

12.1 Intellectual Priority

Intellectual priority for ERES constitutional proposals was established through the Hague filing of March 2026 (ERES-HAGUE-2026-001). This filing establishes ERES priority for the governance, equity, and attestation proposals on which the licensed offerings rest.

12.2 Cryptographic and Attestation Standards

ERES attestation operates under the ERES Attestation and Authorization Protocol (EAAP), currently at v1.2, with confirmed post-quantum migration paths to ML-DSA (FIPS 204) and Falcon. The EAAP includes a Certificate Revocation List (EAAP-CRL) service for revocation of compromised attestations. All licensed offerings emit attestations under EAAP.

12.3 Open-Source License

The ERES open-source substrate (Talonics, CyberRAVE-72 IRI Matrices, and related supporting materials) is released under the CARE Commons Attribution License v2.1 (CCAL v2.1), with MIT compatibility for code components and CC BY-SA 4.0 for documentation. CCAL v2.1 is a share-alike license requiring derivative works to publish under the same or compatible terms.

12.4 Equity Covenant

ERES commercial operations are governed by the ERES Equity Covenant (ERES-COVENANT-2026-001), which establishes the equity-flow obligations attached to commercial activity and protects the Co-Founder governance structure. Prospective licensees should review the Covenant prior to engagement.

13. Engagement Path

Prospective licensees interested in any of the five offerings may initiate engagement through the following path:

13.1 Initial Contact

Email: eresmaestro@gmail.com. Reference the offering of interest (PlayNAC/VERTECA, Infomediary/SECUIR, HowWay/CyberRAVE, SLA-Fulfillment/Gunnysack, or SCALULAR/SaleBuilders) in the subject line. Initial contact should include organization, scope of interest, and rough timeline.

13.2 Discovery Call

Following initial contact, a discovery call is scheduled. The discovery call covers customer scope, fit assessment, engagement model selection, and indicative pricing for the customer's situation. The discovery call is provided at no cost.

13.3 Scope Memorandum

Following the discovery call, ERES prepares a Scope Memorandum specifying: licensed offering(s), scope, deliverables, engagement model (Tier A or A-plus-reserved-B), indicative pricing, attestation framework, timeline, and Co-Founder signatures required. The Scope Memorandum is the basis for the licensing agreement.

13.4 Licensing Agreement

The licensing agreement is executed under the ERES standard licensing framework, with terms specific to the engagement. Both Co-Founders sign all binding instruments. Following execution, engagement commences per the agreed timeline.

A note on cadence

ERES is a small institute with disability-aware engagement constraints. Cadence from initial contact through executed licensing agreement is typically four to ten weeks. Prospective licensees with urgent needs should signal urgency in initial contact so that ERES can advise on whether the timeline is workable.

14. Closing

The ERES Institute has spent fourteen years building the substrate, the upstream protocol, the four licensable offerings, and the App-Parent engine described in this whitepaper. The six-element architecture — IDIPITIS upstream; PlayNAC, Infomediary, HowWay, and SLA-Fulfillment as licensable function-vessel pairs; SCALULAR as App-Parent — is the commercial expression of that work.

The offerings rest on an open substrate so that customers can verify what they are buying. The offerings carry attestation so that customers can prove what they have done. The offerings run on an App-Parent whose CARE-compliance is structural rather than policy-imposed. The offerings operate under a Co-Founder Institute so that customers can trust the standing of the entity they are licensing from. These four properties — open substrate, attested operation, structural compliance, accountable institution — are the differentiators ERES brings to a market that increasingly requires them.

Prospective licensees, institutional partners, and standards-body engagement inquiries are welcomed.

End of whitepaper. *ERES-LICENSING-WP-2026-001 · Version 1.0 · 11 May 2026.*

Joseph Allen Sprute and Dalia Sprute, Co-Founders, ERES Institute for New Age Cybernetics. CCAL v2.1.
